# Methods to determine weak phases from charmless Dalitz plots an experimental perspective 

Tim Gershon $2^{\text {nd }}$ B2TIP meeting; Krakow

29 April 2015

## A potential treasure trove

- There is a lot of discussion about discrepancies in flavour physics that may stay or may go with more data
- However, there are (at least three) that will certainly stay
- The $\pi K$ puzzle
- CP violation in $B \rightarrow 3 h$
- The $\mathrm{B} \rightarrow \mathrm{VV}$ polarisation puzzle
- These can, of course, all be argued away (not explained) by QCD, but let's hope to do better

## Contents

- $\mathrm{B} \rightarrow \pi \pi \pi$
- $\mathrm{B} \rightarrow \mathrm{K} \pi \pi$

## Snyder-Quinn method for $\alpha$

Measuring $C P$ asymmetry in $B \rightarrow \rho \pi$ decays without ambiguities
Arthur E. Snyder and Helen R. Quinn
Stanford Linear Accelerator Center, Stanford University, Stanford, California 94309 (Received 24 February 1993)

- Methods to measure $\alpha$ exploit time-dependent $C P$ violation in $B_{d}$ decays via $b \rightarrow u$ transitions (eg. $B_{d} \rightarrow \pi^{+} \pi^{-}$)

PRL 65 (1990) 3381

- Penguin "pollution" can be subtracted using Gronau-London isospin triangles built from $\mathrm{A}\left(\pi^{+} \pi^{-}\right), \mathrm{A}\left(\pi^{+} \pi^{0}\right), \mathrm{A}\left(\pi^{0} \pi^{0}\right)$

- Expect discrete ambiguities in the solution for $\alpha$
- Ambiguities can be resolved if you measure both real and ${ }^{\mid \pi /}$ imaginary parts of $\lambda=(q / p)(\bar{A} / A)$
- ie. measure $\cos (2 \alpha)$ as well as $\sin (2 \alpha)$

## Toy model for $B \rightarrow \pi^{+} \pi^{-} \pi^{0}$ Dalitz plot

## 27 parameters renamed "U" and "l" in commonly used notation

Contributions only from $\rho^{+} \pi^{-}, \rho^{-} \pi^{+}$and $\rho^{0} \pi^{0}$
PRD 48 (1993) 2139
TABLE I. The time and kinematic dependence of contributions to the distribution of events.

| Time dependence | Kinematic form | Amplitude measured | $\alpha$ dependence (all $P_{i}=0$ ) |
| :---: | :---: | :---: | :---: |
| 1 | $f^{+} f^{+*}$ | $S_{3} S_{3}^{*}+\bar{S}_{4} \bar{S}_{4}^{*}$ | 1 |

FIG. 10: Proper time distributions of good tag ( $r>0.5$ ) regions for $f_{\text {tag }}=B^{0}$ (upper) and $f_{\text {tag }}=\bar{B}^{0}$ (middle upper), in $\rho^{+} \pi^{-}$(left), $\rho^{-} \pi^{+}$(middle), $\rho^{0} \pi^{0}$ (right) enhanced regions, where solid (red), dotted, and dashed curves correspond to signal, continuum, and $B \bar{B}$ PDFs. The middle lower and lower plots show the background-subtracted asymmetries in the good tag $(r>0.5)$ and poor tag $(r<0.5)$ regions, respectively. The significant asymmetry in the $\rho^{-} \pi^{+}$enhanced region (middle) corresponds to a non-zero value of $U_{-}^{-}$.

$$
\rho^{+} \pi^{-} \quad \rho^{-} \pi^{+} \quad \rho^{0} \pi^{0}
$$

## $B \rightarrow \pi^{+} \pi^{-} \pi^{0}-B$ factory results

"the extraction of $\alpha$ with our
Contour from $B \rightarrow \pi^{+} \pi^{-} \pi^{0}$ only
current sample size is not robust"

## Comment on $B \rightarrow \pi^{+} \pi^{-} \pi^{0}$

- It is not clear (to me) whether the current sensitivity to $\alpha$ can be extrapolated
- are we just measuring fluctuations?
- It has been observed that $D \rightarrow \pi^{+} \pi^{-} \pi^{0}$ is close to pure CP-even
- maybe there is a fundamental reason for this
- maybe it is relevant also for $B \rightarrow \pi^{+} \pi^{-} \pi^{0}$ ?
- if so, what is the impact on the Snyder-Quinn method to measure $\alpha$ ?

## $\mathrm{B} \rightarrow \mathrm{K} \pi \pi$

- PRD 74 (2006) 051301, PRD 75 (2007) 014002

$$
\mathcal{A}_{\frac{3}{2}}\left(K^{*} \pi\right)=\frac{1}{\sqrt{2}} \mathcal{A}\left(B^{0} \rightarrow K^{*+} \pi^{-}\right)+\mathcal{A}\left(B^{0} \rightarrow K^{* 0} \pi^{0}\right) .
$$

- Construct pure $I=3 / 2$ amplitude for $B$ and $\bar{B}$
- Dalitz plot analysis of $\mathrm{B}^{0} \rightarrow \mathrm{~K}^{+} \pi^{-} \pi^{0}$
- Relative phase between $B$ and $\bar{B}$ gives $y$
- Dalitz plot analysis of $\mathrm{B}^{0} \rightarrow \mathrm{~K}_{\mathrm{s}} \pi^{+} \pi^{-}$
- corrections due to electroweak penguins

BaBar PRD83 (2011) 112010

## $\mathrm{B}^{0} \rightarrow \mathrm{~K}^{+} \pi^{-} \pi^{0}$

## $\mathrm{B}^{0} \rightarrow \mathrm{~K}^{+} \pi^{-} \pi^{0}$

Isospin triangles drawn to scale of experimental results but without uncertainties

Cancellation makes pure $\mathrm{I}=3 / 2$ amplitude small - impossible to determine its relative phase

Method may work better for $\mathrm{\rho K}$ amplitudes - but current uncertainty is large

## The $\mathrm{B} \rightarrow \mathrm{K} \pi$ puzzle

- QCD may also be a cause of apparently anomalous CP violation effects

$$
\Delta A_{\mathrm{CP}}(\mathrm{~K} \pi)=\mathrm{A}_{\mathrm{CP}}\left(\mathrm{~K}^{+} \pi^{-}\right)-\mathrm{A}_{\mathrm{CP}}\left(\mathrm{~K}^{+} \pi^{0}\right) \neq 0 \quad 10 \text { HFAG averages }
$$

- Look for similar effects in $\mathrm{K}^{*} \pi$ \& $\mathrm{K} \rho$ systems

$$
\begin{aligned}
& \text { Interesting pattern } \\
& \text { emerging? Need } \\
& \text { new results from } \\
& \text { Belle \& LHCb }
\end{aligned}

## $\mathrm{B}_{\mathrm{s}}^{0} \rightarrow \mathrm{~K} \pi \pi$ ?

- Same method works, in principle, for $\mathrm{Bs}^{0} \rightarrow \mathrm{~K} \pi \pi$
- Yields available are, however, small

Observation of $\mathrm{B}_{\mathrm{s}}{ }^{0} \rightarrow \mathrm{~K}_{\mathrm{s}} \pi^{+} \pi^{-}$

## $\mathrm{B}_{\mathrm{s}}^{0} \rightarrow \mathrm{KK} \pi$ ?

- Similar method works, in principle, for $B_{s}{ }^{0} \rightarrow K K \pi$
- Reasonable yields available, but tagged time-dependent analysis necessary

Observation of $\mathrm{B}_{\mathrm{s}}{ }^{0} \rightarrow \mathrm{~K}_{\mathrm{s}} \mathrm{K}^{+-} \pi^{-+}$

## $B \rightarrow 3 h$

- Experimentally, the most accessible decays are those with three final state tracks
- There is much literature on the possibility to measure weak phases through interference between charmless and charmonium contributions (however, not clean theoretically)
- Possibilities to use U-spin to relate decays
- model-independent approaches
- how to relate points in two different Dalitz plots?

## $C P$ violation in $B \rightarrow 3 h$

PRL 111 (2013) 101801

PRL 112 (2014) 011801

Tim Gershon
Large CPV effects not associated with resonances ${ }^{18}$
QCD effects to be understood

## Summary

- Much physics potential in charmless hadronic decays ...
- and in three-body decays in particular
- Need smart methods to overcome hadronic uncertainties
- These often involve analyses of >1 Dalitz plot
- much work needed!
- Some ideas for model-independent analyses
- good DP modelling is nevertheless essential
- Many modes where sensitivity of Belle II is expected to surpass that of LHCb (but don't be complacent)
