

Current challenges and future prospects for measuring y from b-hadron → Dhh' decays Tim Gershon, University of Warwick on behalf of the LHCb collaboration CKM2016, 1st December 2016

Importance of γ from $B \rightarrow DK(\pi)$

• y plays a unique role in flavour physics

the only CP violating parameter that can be measured through tree decays (*)

(*) more-or-less

- A benchmark Standard Model reference point
 - doubly important after New Physics is observed

Variants use different B or D decays

require a final state common to both D^0 and \overline{D}^0

Power of Dalitz plot analyses

- Interference between resonances in a Dalitz plot (DP) provides additional sensitivity to relative phases
 - avoid quasi-two-body (Q2B) assumption that introduces hadronic parameters
- Example: $B^0 \rightarrow DK^+\pi^-$ (PR D79 (2009) 051301, D80 (2009) 092002)

Dalitz plot analysis of $B^0 \to \overline{D}{}^0 K^+ \pi^-$

PR D92 (2015) 012012

• Treating $\overline{D}^0 \rightarrow K^+\pi^-$ decays as flavour-specific

Dalitz plot analysis of $B^0 \rightarrow \overline{D}^0 K^+ \pi^-$

PR D92 (2015) 012012

• Treating $\overline{D}{}^0 \rightarrow K^+\pi^-$ decays as flavour-specific

Dalitz plot analysis of $B^0 \to DK^+\pi^-$

PR D93 (2016) 112018

• Simultaneous DP fit to $D \to K^+\pi^-, \ K^+K^-, \ \pi^+\pi^-$

$\gamma \ from \ B^0 \to DK^+\pi^-$

PR D93 (2016) 112018

• Simultaneous DP fit to $D \to K^+\pi^-, \ K^+K^-, \ \pi^+\pi^-$

[technical detail: simultaneous fit using Laura++ (arXiv:1603.00752) with *jFit* method (arXiv:1409.5080)]

- (D π) resonance amplitudes same for D \rightarrow K⁺ π^- , K⁺K⁻, $\pi^+\pi^-$
- (K π) amplitudes modified for D \rightarrow K⁺K⁻, $\pi^+\pi^-$: sensitivity to γ

$\gamma \ from \ B^0 \to DK^+\pi^-$

Projections contain only partial information from the Dalitz plot analysis

... but no clear asymmetry in $B^0 \rightarrow DK^*(892)^0$

... results consistent with Q2B GLW analysis (PR D90 (2014) 112002)

y from $B^0 \rightarrow DK^{*0}$ Q2B & DP

Comparison of results in terms of $x_{\pm} = r_{B}\cos(\delta_{B}\pm\gamma)$, $y_{\pm} = r_{B}\sin(\delta_{B}\pm\gamma)$ Tim Gershon P RED: (x_{\pm}, y_{\pm}) , BLUE (x_{\pm}, y_{\pm})

two modes consistent at 2σ level

γ from B⁰ \rightarrow DK*⁰ from DP analysis

See talk by F. Machefert for details

y from $B^0 \rightarrow DK^{*0}$ (combined)

Prospects for γ from $B^0 \to DK^+\pi^-$

- Reduce statistical uncertainties
 - Run II data taking going very well; excellent long term prospects
- Reduce model uncertainty
 - Develop better understanding of K π & D π S-waves
 - Work ongoing (e.g. $B^+ \rightarrow D^-\pi^+\pi^+$ Dalitz plot analysis; PR D94 (2016) 072001)
- Control background from $B_s{}^0 \to D^{(\star)}K^-\pi^+$ decays
 - − $B_s^0 \rightarrow \overline{D}{}^0K^-\pi^+$ DP analysis already done (PRL 113 (2014) 162001; PR D90 (2014) 072003)
 - Study $B_s^0 \rightarrow \overline{D}^{*0}K^-\pi^+$ directly; also investigate $B_s^0 \rightarrow D^-K^-\pi^+\pi^+$ decays
- Add more D modes
 - Inclusion of ADS $D \to K\pi$ requires good control of $B_s{}^{_0}$ background
 - will improve sensitivity and enable best control of suppressed amplitude contributions
 - Inclusion of $D \rightarrow K_s \pi^+\pi^-$ possible with "double Dalitz plot analysis" (PR D81 (2010) 014025)

Other $b \rightarrow Dhh'$ modes

- How about isospin partner: $B^+ \rightarrow DK^+\pi^0$? Experimentally challenging but worthwhile?
- Challenge:
 - (D\pi) resonances now not flavour tagged $\rightarrow\,$ require more complicated formalism compared to $B^{0} \rightarrow DK^{+}\pi^{-}$
- Possible benefit:
 - More interference between $b \rightarrow u \& b \rightarrow c$ amplitudes \rightarrow more sensitivity to γ
- Extra information:
 - Relative magnitude (r_B) of b \rightarrow u & b \rightarrow c amplitudes in (D π) resonances can be known from B⁺ \rightarrow D⁺K⁺ π^{-} and B⁺ \rightarrow D⁻K⁺ π^{+} decays (N. Sinha PR D70 (2004) 097501)
- Previous work:
 - Same channel investigated by Aleksan, Petersen & Soffer (PR D67 (2003) 096002), but with assumptions that are now known to be too simplistic

Requires a careful study – see talk by TG at ICHEP2016

$B^+ \to D^+ K^+ \pi^-$ and $B^+ \to D^- K^+ \pi^+$ decays

PR D91 (2015) 092002, PR D93 (2016) 051101

• Recent first observations of both modes by LHCb

$B^+ \rightarrow D^+ K^+ \pi^-$ and $B^+ \rightarrow D^- K^+ \pi^+$ decays

PR D91 (2015) 092002, PR D93 (2016) 051101

from b/→/ Dhh'

Recent first observations of both modes by LHCb

$B^+ \to DK^+\pi^+\pi^- \ decays$

PRL 108 (2012) 161801

• Apply similar ideas to four-body final state?

- Possible contribution from $\overline{D}_1(2420)^{\circ}K^+$ seen with 35/pb of data
 - Decays $D_1(2420) \rightarrow D^*\pi$ and $D(\pi\pi)$ allow interference between flavour-tagged and untagged D mesons in same final state
- $B^+ \rightarrow DK_1^+ \rightarrow DK^+\pi^+\pi^-$ also sensitive to γ (pr D92 (2015) 112005)

$B_s^{0} \rightarrow DK^+K^-$ decays

PRL 109 (2012) 131801; PL B727 (2013) 403

- Full analysis requires flavour-tagging \rightarrow less sensitive
- Evidence for three-body $B_s^0 \rightarrow \overline{D}{}^0K^+K^-$ decay in 0.62/fb

• Observation of $B_s^0 \rightarrow \overline{D}{}^0 \phi$ in 3/fb

 $\Lambda_{h}^{0} \rightarrow DpK^{-}$ decays

• $\Lambda_b^{\ 0} \rightarrow D^0 p K^-$ decay observed in 1/fb

- signal yield of 163 ± 18

- Kinematics limits overlap between (Dp) and (pK) resonances
 - gain relative to Q2B analysis unclear

Summary

- b-hadron \rightarrow Dhh' decays provide many interesting ways to determine γ
 - Dalitz plot analysis methods particularly sensitive
- Results from $B^{0} \rightarrow DK^{*0}$ give competitive sensitivity to those from $B^{+} \rightarrow DK^{+}$
 - Precision will improve more as further D modes added
 - Will be interesting to see how central value of $r_B(DK^{*0})$ evolves
- Other b-hadron \rightarrow Dhh' modes well worth pursuing
 - Strong impact on y unlikely (now a precision measurement)
 - May find surprises (also in hadronic/spectroscopy aspects)

Dalitz plot analysis of $B^0 \rightarrow \overline{D}^0 K^+ \pi^-$
