# Non-Neutral Decision Making in Stochastic Teams and Games 

TAMER BAȘAR<br>Beckman Institute Dept ECE, CAS, CSL and ITI, UIUC basar1@illinois.edu

GAM Workshop
University of Warwick, Coventry
April 14-17, 2010

## OUTLINE

- Neutrality and non-classical information in control and dynamic games
- Some caveats and counter-examples
- Tractable problems with non-classical information
- Limited action teams / games
- Subtleties in games with noisy information channels (even with classical information)
- Conclusions

## Neutrality

A stochastic control problem is neutral if, roughly speaking, the quality of information carried to future stages is independent of past controls. If control policies can shape future information, then problem is non-neutral. In this case, there is generally a conflict between action and probing roles of control -- dual control.

## Separation / Neutrality

April 17, 2010 GAM

A stochastic decision problem is one with non-classical information, if a decision unit, B, that follows another one, $\mathbf{A}$, and whose actions are coupled, does not have all the information acquired and used by $\mathbf{A}$.

## A stochastic decision problem is

 one with non-classical information, if a decision unit, $\mathbf{B}$, that follows another one, A, and whose actions are coupled, does not have all the information acquired and used by $\mathbf{A}$.

April 17, 2010 GAM

versus

April 17, 2010 GAM

## Non-classical

$$
\mathrm{x} \sim \mathrm{~N}\left(0, \sigma_{\mathrm{x}}^{2}\right) \quad \mathrm{w} \sim \mathrm{~N}\left(0, \sigma_{\mathrm{w}}^{2}\right)
$$

$$
\mathrm{J}\left(\gamma_{0}, \gamma_{1}\right)=\mathrm{E}\left[\mathrm{Q}\left(\mathrm{x}, \mathrm{u}_{0}, \mathrm{u}_{1}\right) \mid \gamma_{0}, \gamma_{1}\right]
$$

$\mathrm{J}^{*}=\min \min \mathrm{J}\left(\gamma_{0}, \gamma_{1}\right)$

## Witsenhausen (1968)

$\mathrm{Q}_{\mathrm{W}}\left(\mathrm{x}, \mathrm{u}_{0}, \mathrm{u}_{1}\right)=\mathrm{k}_{0}\left(\mathrm{u}_{0}-\mathrm{x}\right)^{2}+\left(\mathrm{u}_{0}-\mathrm{u}_{1}\right)^{2}$
$\square$ optimal control law exists, but its structure is not known

## Witsenhausen (1968)

$\mathrm{Q}_{\mathrm{W}}\left(\mathrm{x}, \mathrm{u}_{0}, \mathrm{u}_{1}\right)=\mathrm{k}_{0}\left(\mathrm{u}_{0}-\mathrm{x}\right)^{2}+\left(\mathrm{u}_{0}-\mathrm{u}_{1}\right)^{2}$
A control law that beats the best linear one:
$\mathrm{u}_{0}=\gamma_{0}(\mathrm{x})=\varepsilon \operatorname{sgn}(\mathrm{x})+\lambda \mathrm{x}$
$\mathrm{u}_{1}=\gamma_{1}(\mathrm{y})=E[\varepsilon \operatorname{sgn}(\mathrm{x})+\lambda \mathrm{x} \mid \mathrm{y}]$
optimize wrt $\varepsilon$ and

## Gaussian Test Channel

$\mathrm{Q}_{\mathrm{TC}}\left(\mathrm{x}, \mathrm{u}_{0}, \mathrm{u}_{1}\right)=\mathrm{k}_{0}\left(\mathrm{u}_{0}\right)^{2}+\left(\mathrm{u}_{1}-\mathrm{x}\right)^{2}$
$\square$ optimal control law (encoder/decoder) exists, and is linear

## Generalized Gaussian Test Channel

$\mathrm{Q}_{\mathrm{GTC}}\left(\mathrm{x}, \mathrm{u}_{0}, \mathrm{u}_{1}\right)=\mathrm{k}_{0}\left(\mathrm{u}_{0}\right)^{2}+\left(\mathrm{u}_{1}-\mathrm{x}\right)^{2}+\mathrm{b}_{0} \mathrm{u}_{0} \mathrm{x}$
$\Longrightarrow$ optimal control law (encoder/decoder) exists, and is linear

## Generalized Gaussian Test Channel

$\mathrm{Q}\left(\mathrm{x}, \mathrm{u}_{0}, \mathrm{u}_{1}\right)=\mathrm{k}_{0}\left(\mathrm{u}_{0}\right)^{2}+\left(\mathrm{u}_{1}-\mathrm{x}\right)^{2}+\mathrm{b}_{0} \mathrm{u}_{0} \mathrm{x}$
$\mathrm{E}[\mathrm{Q}]=\mathrm{F}\left(\gamma_{0}, \gamma_{1}\right) \geq \mathrm{k}_{0} \alpha+\beta+\inf _{\gamma} \mathrm{b}_{0} \mathrm{E}\left[\gamma_{0}(\mathrm{x}) \mathrm{x}\right]$
$\geq k_{0} \alpha+\beta-\operatorname{sgn}\left(b_{0}\right) \sigma_{x} \sqrt{ } \alpha$

## Generalized Gaussian Test Channel

$\mathrm{Q}\left(\mathrm{x}, \mathrm{u}_{0}, \mathrm{u}_{1}\right)=\mathrm{k}_{0}\left(\mathrm{u}_{0}\right)^{2}+\left(\mathrm{u}_{1}-\mathrm{x}\right)^{2}+\mathrm{b}_{0} \mathrm{u}_{0} \mathrm{x}$ $\mathrm{E}[\mathrm{Q}]=\mathrm{F}\left(\gamma_{0}, \gamma_{1}\right) \geq \mathrm{k}_{0} \alpha+\beta+\inf _{\gamma} \mathrm{b}_{0} \mathrm{E}\left[\gamma_{0}(\mathrm{x}) \mathrm{x}\right]$
$\geq \mathrm{k}_{0} \alpha+\beta-\operatorname{sgn}\left(\mathrm{b}_{0}\right) \sigma_{\mathrm{x}} \sqrt{ } \alpha$
DPT: $\quad \mathrm{I}\left(\mathrm{U}_{0} ; \mathrm{Y}\right) \geq \mathrm{I}\left(\mathrm{X} ; \mathrm{U}_{1}\right)$

April 17, 2010 GAM

## Generalized Gaussian Test Channel

$\mathrm{Q}\left(\mathrm{x}, \mathrm{u}_{0}, \mathrm{u}_{1}\right)=\mathrm{k}_{0}\left(\mathrm{u}_{0}\right)^{2}+\left(\mathrm{u}_{1}-\mathrm{x}\right)^{2}+\mathrm{b}_{0} \mathrm{u}_{0} \mathrm{x}$
$\mathrm{E}[\mathrm{Q}]=\mathrm{F}\left(\gamma_{0}, \gamma_{1}\right) \geq \mathrm{k}_{0} \alpha+\beta+\mathrm{inf}_{\gamma} \mathrm{b}_{0} \mathrm{E}\left[\gamma_{0}(\mathrm{x}) \mathrm{x}\right]$
$\geq \mathrm{k}_{0} \alpha+\beta-\operatorname{sgn}\left(\mathrm{b}_{0}\right) \sigma_{\mathrm{x}} \sqrt{ } \alpha$
$(1 / 2) \log \left(1+\left(\alpha / \sigma_{w}{ }^{2}\right)\right) \geq \mathrm{I}\left(\mathrm{U}_{0} ; \mathrm{Y}\right) \geq \mathrm{I}\left(\mathrm{X} ; \mathrm{U}_{1}\right) \geq(1 / 2) \log \left(\sigma_{\mathrm{x}}{ }^{2} / \beta\right)$ $C(\alpha)$

## Generalized Gaussian Test Channel

$\mathrm{Q}\left(\mathrm{x}, \mathrm{u}_{0}, \mathrm{u}_{1}\right)=\mathrm{k}_{0}\left(\mathrm{u}_{0}\right)^{2}+\left(\mathrm{u}_{1}-\mathrm{x}\right)^{2}+\mathrm{b}_{0} \mathrm{u}_{0} \mathrm{x}$
$\mathrm{E}[\mathrm{Q}]=\mathrm{F}\left(\gamma_{0}, \gamma_{1}\right) \geq \mathrm{k}_{0} \alpha+\beta+\mathrm{inf}_{\gamma} \mathrm{b}_{0} \mathrm{E}\left[\gamma_{0}(\mathrm{x}) \mathrm{x}\right]$
$\geq \mathrm{k}_{0} \alpha+\beta-\operatorname{sgn}\left(\mathrm{b}_{0}\right) \sigma_{\mathrm{x}} \sqrt{ } \alpha$
$(1 / 2) \log \left(1+\left(\alpha / \sigma_{w}{ }^{2}\right)\right) \geq \mathrm{I}\left(\mathrm{U}_{0} ; \mathrm{Y}\right) \geq \mathrm{I}\left(\mathrm{X} ; \mathrm{U}_{1}\right) \geq(1 / 2) \log \left(\mathrm{\sigma}_{\mathrm{x}}{ }^{2} / \beta\right)$ $\Rightarrow \quad \beta \geq \sigma_{w}^{2} \sigma_{x}^{2} /\left(\sigma_{w}^{2}+\alpha\right)$

## Generalized Gaussian Test Channel

$\mathrm{Q}\left(\mathrm{x}, \mathrm{u}_{0}, \mathrm{u}_{1}\right)=\mathrm{k}_{0}\left(\mathrm{u}_{0}\right)^{2}+\left(\mathrm{u}_{1}-\mathrm{x}\right)^{2}+\mathrm{b}_{0} \mathrm{u}_{0} \mathrm{x}$
$\mathrm{E}[\mathrm{Q}]=\mathrm{F}\left(\gamma_{0}, \gamma_{1}\right) \geq \mathrm{k}_{0} \alpha+\beta+\inf _{\gamma} \mathrm{b}_{0} \mathrm{E}\left[\gamma_{0}(\mathrm{x}) \mathrm{x}\right]$
$\geq \mathrm{k}_{0} \alpha+\beta-\operatorname{sgn}\left(\mathrm{b}_{0}\right) \sigma_{\mathrm{x}} \sqrt{ } \alpha$
$\Rightarrow \quad \beta \geq \sigma_{\mathrm{w}}{ }^{2} \sigma_{\mathrm{x}}{ }^{2} /\left(\sigma_{\mathrm{w}}{ }^{2}+\alpha\right)$
Inequality is tight with $\gamma_{0}(x)=-\operatorname{sgn}\left(b_{0}\right)\left(\sqrt{ } \alpha / \sigma_{x}\right) x$

## Generalized Gaussian Test Channel

$\mathrm{Q}\left(\mathrm{x}, \mathrm{u}_{0}, \mathrm{u}_{1}\right)=\mathrm{k}_{0}\left(\mathrm{u}_{0}\right)^{2}+\left(\mathrm{u}_{1}-\mathrm{x}\right)^{2}+\mathrm{b}_{0} \mathrm{u}_{0} \mathrm{x}$
$\mathrm{E}[\mathrm{Q}]=\mathrm{F}\left(\gamma_{0}, \gamma_{1}\right) \geq \mathrm{k}_{0} \alpha+\beta-\left|\mathrm{b}_{0}\right| \sigma_{\mathrm{x}} \sqrt{ } \alpha$

$$
\geq k_{0} \alpha+\sigma_{w}{ }^{2} \sigma_{x}{ }^{2} /\left(\sigma_{w}{ }^{2}+\alpha\right)-\left|b_{0}\right| \sigma_{x} \sqrt{ } \alpha
$$

Obtain the $\alpha$ that minimizes the bound --> $\alpha^{4}$ Then, $\gamma_{0}{ }^{*}(\mathrm{x})=-\operatorname{sgn}\left(\mathrm{b}_{0}\right)\left(\sqrt{ } \alpha^{*} / \sigma_{x}\right) \mathrm{x}, \gamma_{1}{ }^{*}(\mathrm{y})=\mathrm{E}[\mathrm{x} \mid \mathrm{y}]$

## Generalized Gaussian Test Channel

$$
\mathrm{Q}\left(\mathrm{x}, \mathrm{u}_{0}, \mathrm{u}_{1}\right)=\mathrm{k}_{0}\left(\mathrm{u}_{0}\right)^{2}+\left(\mathrm{u}_{1}-\mathrm{x}\right)^{2}+\mathrm{b}_{0} \mathrm{u}_{0} \mathrm{x}
$$

One of the few instances when static/causal coding (and linear in this case) leads to attainment of equality in $C(\alpha) \geq R(\beta)$

## Revisit: Witsenhausen (1968)

$$
\mathrm{Q}\left(\mathrm{x}, \mathrm{u}_{0}, \mathrm{u}_{1}\right)=\mathrm{k}_{0}\left(\mathrm{u}_{0}-\mathrm{x}\right)^{2}+\left(\mathrm{u}_{0}-\mathrm{u}_{1}\right)^{2}
$$

Because of the product term $\mathrm{u}_{0} \mathrm{u}_{1}$ the preceding analysis does not apply here

April 17, 2010 GAM

## However, with Conflicting Objectives

$\mathrm{Q}_{\mathrm{G}}\left(\mathrm{x}, \mathrm{u}_{0}, \mathrm{u}_{1}\right)=-\mathrm{k}_{0}\left(\mathrm{u}_{0}-\mathrm{x}\right)^{2}+\left(\mathrm{u}_{0}-\mathrm{u}_{1}\right)^{2}$
$\mathrm{J}_{*}=\min \max \mathrm{J}\left(\gamma_{0}, \gamma_{1}\right)$
$\gamma_{1} \quad \gamma_{0}$
$\Rightarrow$ Unique saddle-point solution, control laws are linear

However, with Conflicting Objectives

$$
\mathrm{Q}_{\mathrm{G}}\left(\mathrm{x}, \mathrm{u}_{0}, \mathrm{u}_{1}\right)=-\mathrm{k}_{0}\left(\mathrm{u}_{0}-\mathrm{x}\right)^{2}+\left(\mathrm{u}_{0}-\mathrm{u}_{1}\right)^{2}
$$

$$
\gamma_{0}^{*}(\mathbf{x})=-\left[\mathbf{k}_{0} /\left(\mathbf{k}_{0}-\left(\lambda^{*}-1\right)^{2}\right)\right] \mathbf{x}, \gamma_{1}^{*}(\mathbf{y})=\lambda^{*} \mathbf{y}
$$ where $\lambda^{*}$ uniquely solves the polynomial eq $f(\lambda)=\left(\sigma_{w}{ }^{2} / \sigma_{x}^{2}\right) \lambda\left[k_{0}-(\lambda-1)^{2}\right]^{2}-k_{0}^{2}(1-\lambda)=0$ in the open interval $\left(\max \left(0,1-\sqrt{ } \mathrm{k}_{0}\right), 1\right)$

## Recap

$\mathrm{Q}_{\mathrm{W}}=\mathrm{k}_{0}\left(\mathrm{u}_{0}-\mathrm{x}\right)^{2}+\left(\mathrm{u}_{0}-\mathrm{u}_{1}\right)^{2}$
conflicting roles
$\mathrm{Q}_{\mathrm{G}}=-\mathrm{k}_{0}\left(\mathrm{u}_{0}-\mathrm{x}\right)^{2}+\left(\mathrm{u}_{0}-\mathrm{u}_{1}\right)^{2} \quad$ aligned roles
$\mathrm{Q}_{\mathrm{TC}}=\mathrm{k}_{0}\left(\mathrm{u}_{0}\right)^{2}+\left(\mathrm{u}_{1}-\mathrm{x}\right)^{2} \quad$ aligned roles

Not only the information structure but also the cost function is a determining factor

## Extensions of the Paradigm

- Noise corrupted access to initial state
- Vector-valued variables
- Stochastic LQG teams
- Non-cooperative games

## Noise Corrupted IS

$$
\mathrm{x} \sim \mathrm{~N}\left(0, \sigma_{\mathrm{x}}^{2}\right), \mathrm{w} \sim \mathrm{~N}\left(0, \sigma_{\mathrm{w}}{ }^{2}\right), \mathrm{v} \sim \mathrm{~N}\left(0, \sigma_{\mathrm{v}}{ }^{2}\right)
$$

$$
\mathrm{J}\left(\gamma_{0}, \gamma_{1}\right)=\mathrm{E}\left[\mathrm{Q}\left(\mathrm{x}, \mathrm{u}_{0}, \mathrm{u}_{1}\right) \mid \gamma_{0}, \gamma_{1}\right]
$$

$\rightarrow$ Similar structural results

## Noise Corrupted IS

GTC: for some unique positive $\alpha^{*}$
$\gamma_{0}{ }^{*}(\mathrm{z})=\alpha^{*} \mathbf{z}, \quad \gamma_{1}{ }^{*}(\mathbf{y})=\mathrm{E}[\mathbf{x} \mid \mathbf{y}] ; \quad \mathbf{z}:=\mathbf{x}+\mathbf{v}$
ZSSG: for some $\lambda^{*}$, root of a $5^{\text {th }}$-order polynomial $\gamma_{0}{ }^{*}(\mathbf{z})=-\left[\mathrm{k}_{0} /\left(\mathrm{k}_{0}-\left(\lambda^{*}-1\right)^{2}\right)\right]\left[\sigma_{\mathrm{x}}^{2} /\left(\sigma_{\mathrm{x}}^{2}+\sigma_{\mathrm{v}}^{2}\right)\right] \mathbf{z}$
$\gamma_{1}{ }^{*}(\mathbf{y})=\lambda^{*} \mathbf{y}$

## Vector-Valued Variables

- Additional difficulties even for GTC, unless decision variables are scalar but channels are vector-valued (next)
- ZSSG is still tractable, and unique SP solution is linear

## A multi-channel extension to GTC

$\lambda_{\mathrm{i}}$ 's are nonzero constants (gains);
$\mathrm{x}, \mathrm{v}, \mathrm{w}_{\mathrm{i}}$ 's are independent, Gaussian random variables

## A multi-channel extension to GTC

April 17, 2010 GAM

## A multi-channel extension to GTC

April 17, 2010 GAM

## A multi-channel extension to GTC

## Stochastic LQG Teams

- To make tractable, one needs a forward channel that informs agents at the front end on garbled decentralized information received at the back end $\boldsymbol{\rightarrow}$ quasi-classical
- $\gamma_{0 i}\left(\mathrm{z}_{\mathrm{i}}\right)$ at back end, $\mathrm{i}=1, \ldots, \mathrm{n}$
- $\gamma_{1 i}\left(\mathrm{y}_{\mathrm{i}}, \mathrm{z}\right)$ at front end $\mathrm{i}=1, \ldots, \mathrm{n}$
- For quadratic teams invoke Radner (62) and extensions

## Vector-Valued Decision Variables (Decentralized)

$$
\begin{aligned}
& u_{0 i}=\gamma_{0}\left(z_{i}\right), z_{i}=C_{i} x+v_{i}, \quad i=1, \ldots, n \\
& u_{1 i}=\gamma_{1 i}\left(z, y_{i}\right), y_{i}=D_{i} u_{0}+w_{i}, \quad i=1, \ldots, n \\
& z=\left(z_{1}, \ldots, z_{n}\right) ; \text { w correlated with } x \\
& \mathrm{z}\left(\gamma_{0}, \gamma_{1}\right)=E\left[Q\left(x, u_{0}, u_{1}\right) \mid \gamma_{0}, \gamma_{1}\right]
\end{aligned}
$$

## Vector-Valued Decision Variables (Decentralized)

$$
\begin{aligned}
& u_{0 i}=\gamma_{0 i}\left(z_{i}\right), z_{i}=C_{i} x+v_{i}, \quad i=1, \ldots, n \\
& u_{1 i}=\gamma_{1 i}\left(z, y_{i}\right), y_{i}=D_{i} u_{0}+w_{i}, \quad i=1, \ldots, n \\
& z=\left(z_{1}, \ldots, z_{n}\right) ; \text { w correlated with } x \\
& J\left(\gamma_{0}, \gamma_{1}\right)=E\left[Q\left(x, u_{0}, u_{1}\right) \mid \gamma_{0}, \gamma_{1}\right]
\end{aligned}
$$

Radner (62): y's jointly Gaussian distributed, Q strictly (jointly) convex
$\Rightarrow$ unique team optimal solution

## Stochastic Nash Games

- Again one needs a forward channel that informs agents at the front end on garbled decentralized information received at the back end (but not actions) $\rightarrow$ quasi-classical
- $\gamma_{0 i}\left(z_{i}\right)$ at back end, $\mathrm{i}=1, \ldots, \mathrm{n}$
- $\gamma_{1 i}\left(y_{i}, z\right)$ at front end $\mathrm{i}=1, \ldots, \mathrm{n}$
- For quadratic games use $T B(74,75,78)$ as extension of Radner (62)

Nash eqm: $\left(\Upsilon_{A}, \Upsilon_{B}, \Upsilon_{C}\right)$ $\Upsilon_{A}$ minimizes $J_{A}\left(\Upsilon_{A}, r_{B}, \Upsilon_{C}\right)$; likewise for B, C

TB (74, 75, 78): y's jointly Gaussian distributed, $\mathrm{Q}_{\mathrm{i}}$ strictly convex + technical condition
$\rightarrow$ unique Nash eqm solution; linear

## Extension to Multi-Stage Scenarios Dynamic Systems

## ZSSDG with common measurements

$$
\begin{aligned}
& \mathrm{dx}_{\mathrm{t}}=\left(\mathrm{Ax}_{\mathrm{t}}+\mathrm{Bu}_{\mathrm{t}}+\mathrm{Dv}_{\mathrm{t}}\right) \mathrm{dt}+\mathrm{Fd} \xi_{\mathrm{t}}, \mathrm{t} \geq 0 \\
& \mathrm{dy}_{\mathrm{t}}=\mathrm{Hx}_{\mathrm{t}} \mathrm{dt}^{2}+\mathrm{Gdw}_{\mathrm{t}}, \quad \mathrm{y}_{0}=0 \text { (common measurement) } \\
& \mathrm{u}_{\mathrm{t}}=\gamma_{\mathrm{t}}\left(\mathrm{y}_{0}{ }^{\mathrm{t}}\right) \quad \mathrm{v}_{\mathrm{t}}=\mu_{\mathrm{t}}\left(\mathrm{y}_{0}{ }^{\mathrm{t}}\right) \\
& \mathrm{PI}=\mathrm{E}\left\{\int_{0}^{\mathrm{tf}_{f}}\left[\left|\mathrm{x}_{\mathrm{t}} \mathrm{l}_{\mathrm{Q}}{ }^{2}+\left|\mathrm{u}_{\mathrm{t}}{ }^{2}-\left|\mathrm{v}_{\mathrm{t}}\right|^{2}\right] \mathrm{dt}+\right| \mathrm{xx}_{\mathrm{tt}} \mathrm{Q}_{\mathrm{i}}^{2}\right\}\right. \\
& \min _{\gamma} \max _{\mu} \mathrm{J}(\gamma, \mu) \rightarrow\left(\gamma^{*}, \mu^{*}\right) \text { say SP }
\end{aligned}
$$

## ZSSDG with common measurements

$d x_{t}=\left(A x_{t}+B u_{t}+D v_{t}\right) d t+F d \xi_{t}, t \geq 0$
$\mathrm{dy}_{\mathrm{t}}=\mathrm{Hx}_{\mathrm{t}} \mathrm{dt}_{\mathrm{t}}+\mathrm{Gdw}_{\mathrm{t}}, \quad \mathrm{y}_{0}=0$ (common measurement)

$$
\mathrm{u}_{\mathrm{t}}=\mathrm{r}_{\mathrm{t}}\left(\mathrm{y}_{0}{ }^{\mathrm{t}}\right) \quad \mathrm{v}_{\mathrm{t}}=\mu_{\mathrm{t}}\left(\mathrm{y}_{0}{ }^{\mathrm{t}}\right)
$$

$\mathrm{PI}=\mathrm{E}\left\{\int_{0}^{\mathrm{tf}_{f}}\left[\left|\mathrm{x}_{\mathrm{t}}\right|_{\mathrm{Q}}{ }^{2}+\left|\mathrm{u}_{\mathrm{t}}{ }^{2}-\left|\mathrm{v}_{\mathrm{t}}\right|^{2}\right] \mathrm{dt}+\mid \mathrm{x}_{\mathrm{tt}} \mathrm{tef}_{\mathrm{i}}^{2}\right\}\right.$ $\min _{\gamma} \max _{\mu} \mathrm{J}(\gamma, \mu) \rightarrow\left(\gamma^{*}, \mu^{*}\right)$
Does certainty equivalence hold?
-- can SP policies from deterministic game be used?

## ZSSDG with common measurements

$d x_{t}=\left(A x_{t}+B u_{t}+D v_{t}\right) d t+F d \xi_{t}, t \geq 0$
$\mathrm{dy}_{\mathrm{t}}=\mathrm{Hx}_{\mathrm{t}} \mathrm{dt}+\mathrm{Gdw}_{\mathrm{t}}, \quad \mathrm{y}_{0}=0$ (common measurement)

$$
\mathrm{u}_{\mathrm{t}}=\gamma_{\mathrm{t}}\left(\mathrm{y}_{0}{ }^{\mathrm{t}}\right) \quad \mathrm{v}_{\mathrm{t}}=\mu_{\mathrm{t}}\left(\mathrm{y}_{0}{ }^{\mathrm{t}}\right)
$$

$\mathrm{PI}=\mathrm{E}\left\{\int_{0}^{\mathrm{tf}}\left[\left|\mathrm{x}_{\mathrm{t}}\right|_{\mathrm{Q}}{ }^{2}+\left|\mathrm{u}_{\mathrm{t}}{ }^{2}-\left|\mathrm{v}_{\mathrm{t}}\right|^{2}\right] \mathrm{dt}+\left|\mathrm{x}_{\mathrm{tf}}\right|_{\mathrm{ef}}^{2}\right\}\right.$ $\min _{\gamma} \max _{\mu} \mathrm{J}(\gamma, \mu) \rightarrow\left(\gamma^{*}, \mu^{*}\right)$
Does certainty equivalence hold? Qualified NO
Building a common filter with $\mathrm{u}, \mathrm{v}$ requires cooperation

## ZSSDG with common measurements

$$
\begin{aligned}
& d x_{t}=\left(A x_{t}+B u_{t}+D v_{t}\right) d t+F d \xi_{t}, t \geq 0 \\
& \mathrm{dy}_{\mathrm{t}}=\mathrm{Hx}_{\mathrm{t}} \mathrm{dt}+\mathrm{Gdw}_{\mathrm{t}}, \quad \mathrm{y}_{0}=0 \text { (common measurement) } \\
& \mathrm{u}_{\mathrm{t}}=\gamma_{\mathrm{t}}\left(\mathrm{y}_{0}{ }^{\mathrm{t}}\right) \quad \mathrm{v}_{\mathrm{t}}=\mu_{\mathrm{t}}\left(\mathrm{y}_{0}{ }^{\mathrm{t}}\right) \\
& \mathrm{PI}=\mathrm{E}\left\{\int_{0}^{\mathrm{tf}^{2}}\left[\left|\mathrm{x}_{\mathrm{t}} \mathrm{Q}^{2}+\left|\mathrm{u}_{\mathrm{t}}{ }^{2}-\left|\mathrm{v}_{\mathrm{t}}\right|^{2}\right] \mathrm{dt}+\right| \mathrm{Ix}_{\mathrm{tt}} \mathrm{Qi}_{\mathrm{i}}^{2}\right\}\right. \\
& \min _{\gamma} \max _{\mu} \mathrm{J}(\gamma, \mu) \rightarrow\left(\gamma^{*}, \mu^{*}\right)
\end{aligned}
$$

Still, there exists a common compensator, and restricted CE/separation holds -- but not complete

## NZSSDG with common

 measurements$$
d x_{t}=\left(A x_{t}+B u_{t}+D v_{t}\right) d t+F d \xi_{t}, t \geq 0
$$

$$
\mathrm{dy}_{\mathrm{t}}=\mathrm{Hx}_{\mathrm{t}} \mathrm{dt}+\mathrm{Gdw}_{\mathrm{t}}, \quad \mathrm{y}_{0}=0 \text { (common measurement) }
$$

$$
u_{t}=\gamma_{t}\left(y_{0}{ }^{t}\right) \quad v_{t}=\mu_{t}\left(y_{0}{ }^{t}\right)
$$

Pli $=E\left\{\int_{0}^{\mathrm{tf}_{f}}\left[\left|\mathrm{x}_{\mathrm{t}}\right|_{Q i}{ }^{2}+\left|\mathrm{u}_{\mathrm{t}}\right|_{\mathrm{Ri}}{ }^{2}+\left|\mathrm{v}_{\mathrm{t}}\right|_{\mathrm{Mi}}{ }^{2}\right] \mathrm{dt}+\left|\mathrm{X}_{\mathrm{tf}}\right|_{Q f i}{ }^{2}\right\}$
$\Rightarrow \mathrm{J}_{\mathrm{i}}(\gamma, \mu) \Rightarrow \operatorname{Nash} \operatorname{eqm}\left(\gamma^{*}, \mu^{*}\right)$

## NZSSDG with common measurements

$$
\mathrm{PIi}=\mathrm{E}\left\{\int_{0}^{\mathrm{tf}_{f}}\left[\left|\mathrm{x}_{\mathrm{t}} \mathrm{l}_{\mathrm{i}}{ }^{2}+\left|\mathrm{u}_{\mathrm{t}}\right|\right|_{\mathrm{Ri}}{ }^{2}+\left|\mathrm{v}_{\mathrm{t}}\right|_{\mathrm{Mi}}^{2}\right] \mathrm{dt}+\left|\mathrm{x}_{\mathrm{tf}}\right|_{\mathrm{Qfi}}^{2}\right\}
$$

$$
\Rightarrow \mathrm{J}_{\mathrm{i}}(\gamma, \mu) \rightarrow \operatorname{Nash} \operatorname{eqm}\left(\gamma^{*}, \mu^{*}\right)
$$

CE/separation does not hold -- NE of deterministic NZSDG cannot be used; not neutral

$$
\begin{aligned}
& d x_{t}=\left(A x_{t}+B u_{t}+D v_{t}\right) d t+F d \xi_{t}, t \geq 0 \\
& \mathrm{dy}_{\mathrm{t}}=\mathrm{Hx}_{\mathrm{t}} \mathrm{dt}_{\mathrm{t}}+\mathrm{Gdw}_{\mathrm{t}}, \quad \mathrm{y}_{0}=0 \text { (common mesasurement) } \\
& \mathrm{u}_{\mathrm{t}}=\gamma_{\mathrm{t}}\left(\mathrm{y}_{0}{ }^{\mathrm{t}}\right) \quad \mathrm{v}_{\mathrm{t}}=\mu_{\mathrm{t}}\left(\mathrm{y}_{0}{ }^{\mathrm{t}}\right)
\end{aligned}
$$

## Recap

- No general theory/approach to non-neutrality
- Not all problems with non-classical information are intractable
- It is not only the information structure but also the structure of the performance index that plays an important role in tractability vs intractability
- With battery limitations and energy conservation in multi agent applications, further research on problems with non-classical information is needed

## THANKS!

April 17, 2010 GAM
