The construction of new scales: a framework and case study of the EUREGIO cross-border region

Working paper series No 165
May 2005

Abstract:

The article proposes a framework for analysing re-scaling processes and applies it to a case study of the Dutch-German EUREGIO cross-border region. While much of the scale debate focuses on the causes and consequences of re-scaling, the article addresses the conditions and circumstances in which new territorial scales emerge and suggests a framework of necessary components of re-scaling processes. Informed by neo-Gramscian thinking, the scales debate as well recent analyses of regionalisation, these are formulated as: political mobilisation, governance building and strategic unification. The case study locates the EUREGIO case with respect to these dimensions. The article concludes that this framework can be used for studying and comparing other re-scaling cases and presents an initial typology for classifying cross-border regions.

Key words: scale, re-scaling, cross-border region, cross-border co-operation Europe, territory.

1 Introduction

Recent transformations of the geographic scale and associated governance modes of public agency have recently attracted much interest by observers (Brenner, 2003; Gualini, 2004; Jessop, 2002; Peck, 2002; Swyngedouw, 2004; Ward & Jonas, 2004). The 're-scaling' debate has highlighted the implications of shifting scales for social forces and populations, and investigated the impact of scales on the role of localities, regions and other socio-geographic formations involved in the wider processes of global production and consumption.

The emergence of cross-border regions (CBRs) provides a paradigmatic case for re-scaling processes. A CBR is a territorial unit that comprises contiguous sub-national units from two or more nation states (Perkmann & Sum 2002a). Since borders were hermetic barriers only on rare occasions in the history of nation states, the existence of integrated cross-border spaces is no novelty as such. What is new is that the construction of CBRs has become a more or less explicit strategic objective pursued by social forces within and beyond border regions. Jessop (2002) has commented on the significance of CBRs within the broader context of state restructuring and has identified a variety of different processes and/or strategies underlying and informing their emergence and consolidation.

Empirically speaking, CBRs are very different in terms of their set-up, roles and social bases, depending on the institutional context they are embedded in. In Europe, CBRs tend to be groupings of local or regional authorities integrated into or attached to the multi-level policy implementation networks constituted by EU regional policy (Perkmann 2003, Anderson, O'Dowd and Wilson 2003). In North America, the building of CBR tends to be more closely associated with particularist and issue-driven interests and they appear more loosely organised with a variety of involved private and public actors (Blatter 2004, Sparke 2002). In East-Asia, some CBRs are constituent part of the so-called growth triangles that, often in association with Special Economic Zones, exploit locational complementarities between territories with different factor prices and competency levels (Sum 2002, Sparke 2004).

So far, the empirical study of cross-border regions and the theoretical debate on re-scaling have not been explicitly linked up; this is where this paper aims to make a contribution. Specifically, it addresses an aspect of re-scaling processes that has failed to gain much attention in the debate. Most contributions to the scale debate focus on two aspects: the *forces* that drive processes of re-scaling, and the *consequences* of re-scaling. In terms of the driving forces, much attention is paid to the underlying contradictions and functional imperatives of global capitalism, and re-scaling is often read as part of experimental strategies to re-structure the spatial scaffolding of global capitalism (Brenner 1998) and provide new configurations of structured coherence (Harvey 1982). In terms of the

consequences, authors have pointed to the role of re-scaled arrangements within strategies of neo-liberal restructuring and deregulation, sometimes at the expense of incumbent local communities (e.g. Swyngedouw 1996).

However, less attention has been paid to how re-scaling actually occurs. What are the general circumstances in which new scales are constructed or transformed? What are the necessary ingredients of successful scale construction? This article proposes a framework for studying processes of re-scaling that can serve to answer these questions and analyse as well as compare concrete cases. While the framework categories are informed by the wider debate on state-theory and regionalisation, they are tested with a case study on the EUREGIO, a Dutch-German cross-border region. The choice of the EUREGIO as a case is pertinent insofar as it is a relatively advanced case of cross-border co-operation (CBC) and, at the same time, there is evidence that its model is followed widely by other similar initiatives across Europe (Perkmann 2003).

The purpose of the exercise is to create an analytical template that can inform further case studies and comparative work aimed to identify different types of re-scaling strategies and scenarios. By demonstrating and uncovering empirical variation across various cases, this might help address the implicitly functionalist bias in much of the current debate on scales and re-scaling, suggesting that the emergence of new scales is invariably driven by the pressures of the global capitalist system. Not dissimilarly, neo-liberal approaches view the emergence of new scales, such as 'natural economic zones' and cross-border regions, as the de-facto manifestation of the economic imperatives of a globalised economy (Ohmae 1995).

To achieve this objective, the article proceeds as follows. After a brief summary of the scale debate, an argument is made in favour of a *territorial* concept of scale in order to clarify the ambiguities associated with the concept. Inspired by Neo-Gramscian state theory as well as recent work on concrete re-scaling processes, such as 'regionalisation', a framework is then presented that encapsulates the main dimensions of re-scaling processes: political mobilisation, governance building and strategic unification. The framework is subsequently applied to an in-depth study of the emergence of the EUREGIO, whereby the presentation of the data is integrated with the discussion and analysis. Concluding, a few remarks are made as to how this framework can be used for studying further cases of re-scaling and an tentative typology of re-scaling processes is proposed.

In terms of method, the empirical work in this article is based on information obtained from two sources: interviews and policy documentation. A total of twenty interviews were carried out with individuals involved in the EUREGIO, the Association of European Border Regions (AEBR) and the European Commission. They included EUREGIO officials, civil servants at member municipalities, municipal associations and districts

(*Bezirksregierungen DE* and *regios NL*) on both sides of the border as well as the Dutch central government and the German *Land* governments of North Rhine-Westphalia (NRW) and Lower Saxony. Interviews were 'face to face', lasted 1.5 hours on average and were semi-structured; they were all taped and transcribed. References to interview evidence are coded according to the format 'i1', 'i2', etc; a list is provided at the end of article. An equally important body of evidence was provided by printed and electronic documentation, in particular policy strategy and planning documents, policy evaluations and public communication materials produced by the EUREGIO, its member authorities, the European Commission, the AEBR, the 'Institut für Landes- und Stadtentwicklungsforschung' in North Rhine Westphalia and other organisations such as consultancies commissioned to evaluate policy measures.

2 Scales and the politics of scale

Commonly, 'geographic scale' can be referred to as a 'graduated series, usually a nested hierarchy of bounded spaces of differing size, such as the local, regional, national and supranational', 'each with a distinct geographic scope, that is, territorial extent' (Delaney and Leitner 1997). In the recent literature, there has been a lively debate about the 'politics of scale', a notion originally coined by Smith (1992), reflecting the assumption that geographical scales are socially constituted in historically specific ways and can hence become a stake in political struggles. This can be read against the background of the 1970s 'locality debate' when a substantivist view of scale postulated intrinsic characteristics of the 'local' (Cooke 1989, Cox and Mair 1989, Duncan and Savage 1989). More recently, authors moved towards a *relational* conception of scale, emphasising the fact that geographic scales are socially constructed and that their precise manifestation can not be derived *a priori* (cf. Howitt, 1993).

Brenner (2001) has made an important contribution to clarify the concept of the politics of scale. He argues against the semantic broadening of the scale concept that he observes in much of the literature on scale, notably an article by Marsden (2000). He proposes a 'plural' meaning of scale, implying that the 'politics of scale' refers to a reconfiguration of particular orderings or hierarchies *among* geographic scales and not *within* a geographic scale. In other words, the politics of scale refers to the changing relationships between geographic scales, and the implications of such interscalar transformation for each of those scales in organisational, discursive and governance-related terms (ibid). Swyngedouw's contributions have elucidated the twin dimensions of scales as sites of regulation and arenas for social formations and struggles. On the first point, the fact that scales produce scalar *effects* can be seen as the very reason for why they become stakes in political struggles aimed at their transformation or maintenance; this is illustrated by Swyngedouw (1996) with the case of the restructuring of the Belgian mines (cf. also

Williams 1999). At the same time, he argues that 'scale' is underpinned by a temporary social compromise' (Swyndegow 1996: 146). Scale hence solidifies existing power relationships, regulates forms of cooperation, and defines power strategies. On the regional level, this process has been described by Lipietz as the creation of 'regional armatures', involving the establishment of a 'space-for-itself' endowed with the capacity to intervene on the part of a particular hegemonic bloc (Lipietz 1994). From such a social-integrative perspective, scale becomes relevant both as a site for control and domination as well as arena for conflicts and co-operation: The 'continuous reshuffling and re-organisation of spatial scales is an integral part of social strategies and struggles for control and empowerment' (ibid: 141).

While these authors emphasise the socially constructed nature of scales *qua* institutions, other authors have pointed out that scale also play an important role as (constructed) discursive referents in political life. Scale discourses, as 'representational tropes' (Jones 1998) can be deployed in political action to provide rationales for specific political projects (Kelly 1997) As Smith argues, 'by setting boundaries, scale can be constructed as a means of constraint and exclusion, a means of imposing identity, but a politics of scale can also become a weapon of expansion and inclusion, a means of enlarging identities. Scale offers guideposts in the recovery of space from annihilation' (Smith 1993: 14).

This short overview has highlighted the regulatory, social-integrative and discursive dimensions of scale. The next section explores the relationship between re-scaling and *territorial* restructuring.

Re-scaling as reconfiguration of territorial governance

The re-scaling debate has highlighted the role of scales – and implicitly their governance effects – as stakes in political struggles. Brenner's critique of the overextensive use of the scale concept – and his plea to focus on its 'plural meaning' - have done much provide better analytical focus. There is still considerable ambiguity left, however, as to what the concept of scale effectively refers to. On the one hand, 'scale' often appears to refer to the *bounded spaces* constituted by the territorial set-up of states, regions or localities that are arenas and objects of public governance. On the other, however, scale also appears to refer to the extension of *processes*, such as commodity chains, firm collaboration or capitalist accumulation in general. While the latter is an important aspect of tendencies such as globalisation, as pointed out by Jessop (1999) and implicit in Castells' (1996) 'spaces of flows', it is distinct from the creation and modification of scales understood as arenas and objects of public governance.

The difference between the two meanings of 'scale' is spelled out by Dicken (1998: 13), who notes that, for instance, industrial commodity chains operate as 'vertical' processes

across increasingly extensive geographical *scales* and '[c]utting across these vertical structures are the territorially defined political-economic systems which (...) are manifested at different geographical scales'. In other words, *vertical* processes such as the manufacturing of industrial products, or the provision of financial services increasingly criss-cross *horizontally* constituted local, regional, national or supranational territories. A similar difference underlies Cox and Mair's (1991) distinction between 'spaces of dependence' and 'spaces of engagement'; here, 'spaces of dependence' refer to the exposure of local communities to processes of various spatial extension while 'spaces of engagement' emerge when localities constitute themselves as an 'agent', i.e. engage in territorial action.

There is a strong argument for limiting the meaning of 'scale' to one of these dimensions in the interest of analytical clarity and I therefore limit my discussion of scales to their 'horizontal' meaning, i.e. understood as spatially bounded units and objects of public governance. These units exist as socially constructed but nevertheless real social entities that are organised according to a specific social relation: *territoriality* (Sack 1986, Badie 1995). It is due to collective governance institutions, e.g. governments, that these scales are *de facto* constituted as objects of governance and targeted by specific policies.

Territorial re-scaling then involves the establishment of governance functions at a scale that is different from they were previously situated. In turn, these governance functions are performed by institutions associated each scale, i.e. relatively stabilised and legitimate patterns of social regulation. Therefore, each re-scaling process can be said to involve the institutionalisation of governance institutions at a new scalar level. A new scale can only be efficacious if it gains a sufficient degree of institutional thickness (Jessop 2002: 29), and can hence become an object for manipulation and contestation.

A precondition for this is that social support is mobilised to provide resources and legitimacy for such territorial strategies; such support might be indirect as in the case of formal jurisdictions where it is provided via institutions of representative democracy. The mobilisation of social support is likely to go hand in hand with the construction of narratives and discourses interwoven with the material (inter)dependencies involved in re-arranging and constructing scales (MacLeod 1998). In particular, for being a 'space of engagement', i.e. a territory with a *capacity to act*, it always must be discursively constituted as such. In this way, the locality (or a region) can develop a 'political capacity' (Ritaine 1998) to engage, for instance, in a territorial project of competitiveness. These ensuing agents are *territorial* actors who act, as it were, 'on behalf' of a territory and whose constitutive legitimacy lies in their capacity to exert relative control over a spatially bounded area.

Such arrangements rely on various articulations of a specific social relation: territoriality. In this respect, Sack's (1986) rather voluntarist definition of territoriality as 'the attempt

by an individual or group to affect, influence, or control people phenomena, and relationships, by delimiting and asserting control over a geographic area' or Cox's (1991) understanding that territories are 'bounded areas or arenas in which conflict occurs' cover only specific aspects of territory.

More comprehensively, territoriality is a social relation that puts social subjects in relation to each other in the basis of a set of rules linked to a bounded geographical space. As Collinge (1999) notes, territoriality refers to the 'socially mediated spatiality of political relations, producing formations which are interpellated as units such as „nations“, „regions“ and „localities“.

As any social relation, 'territoriality' is an abstract principle for creating and reproducing social order but, at the same time, it has to be regarded as historically constructed and historically evolving. Badie (1995) shows how 'modern territoriality' emerged as a counter-movement to other modes of socio-spatial organisation, such as the empire, the feudal system or the city-state at the end of the middle ages. He observes that, at the transition from feudal territory to modern territoriality, 'bounding' became the instrument of choice for these new strategies of domination [via modern territoriality, my translation] (Badie 1995: 33). The bounding of spaces went hand in hand with the establishment of (the idea of) a single *sovereign* authority equipped with exclusive power over a homogenous territory, as opposed to the entangled and multiple patchwork instituted by feudal domination over land and populations.

The way in which territories are defined, and how they relate to each other – both between and within states – constitute an important moment for defining the relative positions of various social actors. In the process of territorialisation, 'politics' can be seen as the strategic and political actions underlying the formation of territory (Steinberg 1994: 3). It follows that each actual instantiation of territory must be regarded as the product of social struggles, in other words: as socially but not necessarily intentionally constructed.

Concluding, for the sake of this present investigation into the issue of scale, territories can be characterised as specific institutionalised forms of social representation and domination based upon bounded geographic spaces and/or its populations. Importantly, territories are also sites of governance as their institutional set-up will generate effects that will be structurally selective vis-à-vis specific social forces on different scales. Thus, they provide institutionalised power positions for social actors for whom (the control of) territory becomes a resource. From such a perspective, the question of scale and, particularly, of re-scaling becomes relevant because shifting spatial boundaries and the government functions associated with them re-configure the social and productive bases of territorial entities and modify thereby, among others, the resource position of territorial actors, and of course, of the territorial communities as a whole. It is clear that the strategies underlying such re-scaling processes will therefore be subject to social

contestation as they can be expected to significantly affect the power, resource appropriation and life chances of a multiplicity of social groups organised at different levels. Narratives and discourses constructing a scale as spatial communities as well as, more instrumentally, as object of intervention, will play an important role in these processes of social contestation and governance re-alignment.

Concluding, a territorial notion of scale sheds light on three interconnected aspects of scale: their nature as social formations, their function as sites of governance and their construction via narratives and discourses. These aspects will be addressed more comprehensively below.

Analysing rescaling processes

As mentioned before, most contributions to the scale debate focus on two aspects: the forces that drive processes of re-scaling, and the consequences of re-scaling. However, less attention has been paid to how re-scaling actually occurs. What are the circumstances in which new scales are constructed or transformed? What are the necessary ingredients of successful scale construction? In the following, a framework is proposed that will serve to analyse concrete cases of re-scaling. The framework lays out the key dimensions of re-scaling processes which are illustrated with the example of a specific case study. While beyond the scope of this paper, future comparative case study work might explore degrees of empirical variation across each of the dimensions of the framework and establish different types of newly emerging scales and the circumstances in which they emerge.

The dimensions presented below are derived from several theoretical sources. First, the scaling debate has pointed to several core aspects relevant within re-scaling processes, largely informed by thinking based on the strategic-relational approach and regulation theory (Jessop 2001). Generally speaking, such approaches postulate the existence of historically specific social formations, representing solidified yet unstable compromises among social forces, and institutionally constituted via modes of calculation and regulatory institutional forms producing specific effects for wider economic and social processes (e.g. MacLeod 1998). In line with such thinking, for instance, is Swyngedow's distinction between scales as regulatory forms and arenas for social formations and struggles.

A further conceptual impetus comes from existing accounts of re-scaling processes, notably 'regionalization' (Balme 1996). Keating (1997) has provided a useful template for analysing a specific type of re-scaling process, regionalisation, by distinguishing between the aspects of *political mobilization* for processes of region-building, *institutional restructuring* resulting in new governance structures and *functional needs* providing rationales for the actors involved in the construction of new scales. Similarly,

Gualini (2004) distinguishes between changes in substantive rationales, procedural rationales and interactional-relational rationales affecting the creation of new territorial scales in a scenario of 'experimental regionalism'.

In light of the scale debate as well as the regionalisation literature, the following dimensions appear to be at the core of re-scaling processes; they can be characterised as social, procedural and substantial respectively:

(a) political mobilisation, i.e. the formation of a social basis underpinning the creation or transformation of a scale. If scales, as noted by Swyngedow, solidify existing power relationships within a temporary hegemonic space, then scales are underpinned and reproduced by specific coalitions of social forces. Political mobilisation then refers to the process through which these coalitions are built and maintained over time.

(b) governance building, referring to emerging arrangements for channelling political and other interests and co-ordinating decision-making. Governance is used here in its broad sense, including exchange, hierarchy and heterarchy (Jessop 1998) but empirically it is most likely that new scales will rely more narrowly on complex configurations of heterarchic arrangements such as networks (e.g. Balme and Jouve 1996).

(c) strategic unification, referring to the construction of a new scale as a unit and object for politico-territorial intervention, constituting a link between strategic intervention and the (intended) effects to be achieved on economic and social processes affecting the territorial scale. Effectively, this aspect refers to the substantive, 'project' dimension infusing social formations with shared visions and cognitive guidelines for action and intervention (Colomy 1998).

Having defined these core dimensions of scale building, they are now applied to the case study of the EUREGIO.

3 Case study: the EUREGIO cross-border region

The general context

The EUREGIO is a Dutch-German cross-border region in the area of Enschede (NL) and Münster (DE), involving approx. 140 local authorities with a total population of 3.2m.¹ Founded in 1958, it is among the oldest cross-border regions in Europe and has established itself as a legitimate and competent agency responsible for cross-border matters in this specific geographic area.² The EUREGIO is governed by a set of formal bodies, most notably an executive board composed by the key member authorities, and a cross-border 'parliament', the EUREGIO Council. A single secretariat with approx. 30 staff functions as the executive branch of the EUREGIO and covers a variety of local

policy areas ranging from spatial planning and economic policy to social and cultural matters.

It has a diversified stream of income of approx. €5.7m (as of 2005), partly from a voluntary membership fee drawn from member authorities. Most of its income, however, is derived from its role as a programme manager for the local implementation of Interreg, the EU's support programme for CBC (Perkmann 1999). Interreg is part of EU regional policy and provides financial support for local public-sector collaboration across member state borders resulting in structural economic benefits to border areas. Total Interreg funding amounts to approx. 2.3 per cent of the EU's Cohesion policy budget.³

The allocation of Interreg funds is governed by Steering Committees responsible for small-scale border areas, composed by local actors and central or *Land* authorities from the participating countries. The EUREGIO is an active member of the Steering Committee responsible for the Dutch-German border area but, across Europe, local CBR organisations are not always involved in the formal decision-making process. This means, the EUREGIO is effectively also a policy implementation partner of the EU commission for these regional policy measures in the Dutch-German border areas.

In the following, the three core dimensions of the EUREGIO as a newly emerging scale are reported and discussed in detail.

Political mobilisation

The origins of the EUREGIO date back to the 1950s when municipal associations on both sides of the border organised the first cross-border conference. The EUREGIO was established as a joint body of three inter-municipal associations which, on their part, had been founded with the objective of pursuing regional collaboration to solve the structural problems of the border areas.⁴ The initial period was characterised by a process of coalition-building across a number of municipalities on both sides of the border that were initially organised within groupings separately for each side of the border.

Their primary interest was to create a platform for the improvement of the local and regional infrastructures which, in the eyes of the local elites, were neglected on the part of the *Land* (North Rhine Westphalia) and central governments. The situation was critical on the German side where high unemployment and structural problems persisted (CoE, 1972). The area was among the poorest in Germany, and suffered from restructuring processes in the textiles sector which accounted for more than 50% of the industrial labour force in the 60s with local rates of up to 80% (Goinga, 1995: 20). In addition, 20% of the labour force still worked in agriculture.

While the municipal groupings were initially unilateral they soon recognised that linking up with their counterparts on the other side of the border would enhance the legitimacy of their claims. Both areas had similar socio-economic structures – partly inherited from a

pre-nation-state past – and the local actors realised that their constituencies suffered from various border effects due to the marginalisation within their respective national economies. Co-operation also appeared promising in addressing the day-to-day border problems, related to commuter flows, business relationships and social contacts.

Even though European integration was at an embryonic level, the existence of a genuine cross-border platform enabled the EUREGIO actors to attach a higher level of legitimacy to their claims vis-à-vis their higher level authorities. Very early, the EUREGIO actors attempted to lobby supra local actors, such as their national central or Land authorities as well as later the Council of Europe and the European Commission, in relation to regional policy measures. The cross-border coalition was successful, for instance, in influencing transport infrastructure decisions, such as the building of motorways connecting the area to the main German networks or the preservation of railway lines (cf. Raich, 1995: 155; i5, i6).

This political mobilisation was clearly driven by bureaucratic interests and remained restricted to the realm of public administration without involving a broader popular mobilisation. However, from early on, the municipal groupings involved, and in turn their member municipalities, sought a degree of broader-based legitimacy for their cross-border strategies as the attention shifted towards building governance structures for the newly-emerging cross-border space. CBC was positioned both as a way of seeking reconciliation after the brutalities of WWII as well as a contribution to the ongoing process of European integration (Schack, 1998). In fact, the initial concrete activities of the EUREGIO focused on cultural matters and ‘know your neighbour’ initiatives which were benevolently regarded by the central governments. This meant that both national and supranational authorities could be successfully approached. An illustrative example is the establishment of the ‘Mozer Commission’ in 1971, a strongly ceremonial body which still exists today and involves a large number of members, involving higher-level authorities, sponsors, guests and advisors. Also, as CBC became part of standard activity repertoire of the local authorities’, they sought to emulate a regional democracy by establishing the ‘EUREGIO Council’ in 1978. The Council is a para-parliamentary body constituted by 64 elected politicians appointed by the member authorities; however, it has no formal legislative competencies although, formally speaking, it is the most authoritative among the EUREGIO bodies.

Summarising, political mobilisation in the EUREGIO was driven by administrative and policy-oriented considerations emerging within the local authorities and their umbrella associations. While the initial impetus resulted from the interest of attracting resource from higher-level authorities, such as the Land, national governments and, later, supranational authorities such as the European Commission, subsequently political support moved to include the building of governance structures for a cross-border space

as a whole. In part, however, this was still informed by the interest of gaining access to resources made available particularly by the European Commission. As will become clear from the account given below, the building of cross-border policy co-ordination structures was particularly relevant for being able to draw upon funding provided by Interreg, the European Commission's programme to support cross-border integration. Both initial political mobilisation and ongoing support for EUREGIO CBC can therefore still be regarded as primarily driven by administrative rationales.

Governance building

CBRs represent a specific challenge within public governance due their atypical, non-nested territorial set-up: As their constituent parts – municipalities, districts and other subnational jurisdictions – belong to different nation states, they do not operate in a conventional context of public administration defined by legal competencies and decision-making mechanisms rooted in public law. CBRs do not have 'governments' but rely on voluntary co-operation within a context of pragmatically defined and mutually recognised set of rules. For a long time, they even operated outside public law and resorted to civil law arrangements (Beyerlin 1998). They can therefore be seen as exemplary for a type of public agency that has been described as 'governance' by authors from a variety of backgrounds in regional and urban studies, political science and organisational studies (Jessop 1998, Le Galès 1998, Amin/Hausner 1997, Kooiman 1993). In various forms, the principle of *governance* – often contrasted to *government* – has widely been connected to the operation of networks among parties willing to co-operate in the absence of a hierarchical instance (Messner 1997, Hanf/O'Toole 1992, Marin/Mayntz 1991).

In light of these challenges, the main question is how a system of networked relationships can be effective in producing a 'scale'. The considerations below provide an example for such a working arrangement for the specific case of the EUREGIO. Empirically speaking, in the EUREGIO, networked governance is instituted on three levels: (a) the EUREGIO secretariat, acting as skilful and knowledgeable network broker; (b) a horizontal border-crossing network of local authorities; (c) a vertical, 'multi-level' network of authorities including local, regional, Land, central state and EU actors.

The EUREGIO as organisation

From an organisational viewpoint, the nodal point of the EUREGIO is its secretariat, which over the last forty years has developed into an organisation with a high degree of specialist competence. The secretariat has no constitutionally instituted competencies nor does it have any guaranteed income streams. At the same time, its mandate is relatively undefined. This enables the secretariat to act in an entrepreneurial fashion as long as it

has the backing of the member authorities. This relative discretion in defining and expanding its tasks has been widely used by the EUREGIO secretariat.

This is reflected in its ability to generate a stable resource flow to maintain its operations. The EUREGIO disposes over a considerable income from sources not related to Interreg, notably from a membership fee charged to the member authorities, approx. EUR .30 per inhabitant in 2005.

The proceeds from the membership fee enable the EUREGIO to pay the overheads out of its own budget. The secretariat proved successful in raising project-related funding long before Interreg was launched. In most cases, local funds were complemented by contributions from NRW and the European Commission. More recently, the secretariat successfully bid for pilot-projects from various other DGs of the European Commission. As a result, today the secretariat operates a range of activities that strengthen its profile as cross-border regional advice and citizen's service centre.

Unlike other Euroregions, the secretariat always sought to avoid overdependence on the mostly temporary resources provided by non-local authorities. Although Interreg constituted a major boost in terms of financial revenues and organisational growth, the secretariat has managed to diversify its revenues and secure stable funding from local sources.

The EUREGIO organisation has established itself as a highly regarded regional development agency in the Dutch-German border area. Based on its expertise and local connectedness, the secretariat exerts considerable informal influence upon EU programme implementation, for several reasons: First, by acting as a project animator, it ensures that all available funds are effectively allocated (i2, i5, i18). Secondly, it has made itself indispensable as a network broker. For genuine cross-border projects, project applicants need partners on the other side of the border; the relevant contacts are usually established by the secretariat (i7). Thirdly, the secretariat uses its administrative expertise to turn initial ideas into project applications ready for submission to the Interreg Steering Committee.

The development of a strong organisational basis – enabled by a steadily increasing resource flow – was crucial for providing the local actors with access to Interreg implementation. In the 1980s, the member municipalities agreed to increase their financial contribution in the expectation that this would help to secure a substantial local impact on the allocation of future European funding. The EUREGIO grasped a strategic opportunity when it was still undecided whether a large-scale CBC support programme would be launched.

The result was that when Interreg was finally launched, with 15 staff members the EUREGIO secretariat was the natural candidate for programme management.⁵ It had

positioned itself as the strategy unit responsible for a range of tasks no other organisation could deal with, becoming the undisputed agency for 'mobilising the region' (i5).

Concluding, the role of the secretariat doubles as both a network broker, securing ongoing co-operation among the members of the network, and a policy entrepreneur, continuously seeking to introduce policy innovations to widen the role and impact of the EUREGIO (Mintrom 1997, Roberts and King 1996, Christopoulos 2001). It developed the EUREGIO from a loose network with strong ceremonial elements into a regional policy agency that has assumed the self-defined mandate of transforming the cross-border region into a 'central location in North-western Europe' with 20m consumers within 150km (Gabbe, 1985: 95). The secretariat has assumed the role of a 'functional government' (Beck 1997) not on the basis of a strong formal mandate but through a skilful moderation and solidification of the horizontal and vertical policy network structures the EUREGIO is embedded in. They are discussed below.

The local network

As a non-mandatory body, the EUREGIO depends on voluntary co-operation among local authorities although common rules and obligations have been defined via formalised agreements. The member authorities are linked via a set of networks that tend to have visible, formalised front-ends as formal bodies. The most important among these is the so-called 'Working Group' that acts as a supervisory board and involves senior civil servants and political office-bearers from the most powerful and active member authorities on both sides of the border. In addition, there are a number of 'Working Circles', specialising in single policy areas and involving expert civil servants from local and supralocal authorities and interest groups. They deal with project-oriented work in various policy fields, such as economic policy, social matters, or 'daily border problems'. The most important feature of these relationships is their *technocratic* nature as the main work load is carried by the expert civil servants. Such technocratic networks are usually more stable than purely 'topocratic' networks composed of politicians and tend to be committed to problem-solving as opposed to pure bargaining (Rhodes, 1990, Benz 1995). This is despite the fact that strategic EUREGIO matters are usually dealt with personally by the top officials who act more like political generalists and, hence, 'topocrats' representing their constituency.

Decision-making and co-ordination even in technocratic networks can be notoriously difficult, especially when it comes to issues of distribution or even re-distribution (Beck 1997). Conflicts, for instance, arise over the geographical distribution of project funding or decisions favouring larger authorities over smaller ones, or urban municipalities over rural ones.

The EUREGIO developed a variety of mechanisms to reduce the conflictuality and complexity of decision-making within the local cross-border networks. With the

secretariat playing an active part as a network broker, the EUREGIO developed a set of norms that maintain a usually productive problem-solving climate, for instance a commitment to the 'long-term' and a sense of distributional fairness. A balanced distribution of project funding over time (to mitigate limited resources) and across space (to secure commitment) is seen as crucial for unifying particularist interests behind a common objective (i5). There is no explicit or implicit formula for distributing Interreg-support between the two countries or between different constituencies (i1, i7, i11). The secretariat enjoys an uncontested reputation for allocating funds even-handedly. This is why decision-making on projects is usually non-conflictual and smaller municipalities are discouraged from defecting. A further factor in reducing the complexity of decision-making in networks is a relatively small number of participants (Messner 1997). In this respect, the municipal associations in the EUREGIO network play a key role by restricting the number of (relevant) participants, while representing the smaller members. At the same time, they are important in securing the commitment of the participating municipalities, even by sometimes paying for their membership (i2).

The vertical network

Apart from the local network, the EUREGIO is also part of a vertical, multi-level network involving regional, national and European policy agencies, essentially constituting a EU cohesion policy implementation network (Heinelt and Smith 1996). These supralocal network linkages provide access to a significant amount of resources, complementing the local resources which can be seen as complementary at best. These relationships were established long before the EUREGIO was given its mandate in Interreg implementation. Its early successes all crucially depended on the support of non-local authorities, in particular the Land NRW, the Dutch government and the European Commission.

The Dutch central government and North Rhine-Westphalia have traditionally adopted a 'CBC-friendly' attitude towards their border municipalities. On the German side, special measures for border areas in spatial planning and economic policy have been deployed since the sixties. North Rhine-Westphalia has also experimented with a variety of innovative regional policy schemes. Initiatives such as 'regional conferences' sought to delegate regional policy to municipalities and districts by involving them into the design and implementation of structural measures in problem areas (Voelzkow 1995). Evidently, the regional mobilisation in border areas, brokered by Euroregions, is similar to these regional conferences.

Even before the launch of Interreg, the European Commission joined the vertical network as an important catalyst and player. Long before Interreg was launched, the EUREGIO had been lobbying the European Commission for CBC support. In 1972, the European Commission helped to fund a first cross-border development plan for the EUREGIO. A

similar solution was found for the 1987 action programme before the EUREGIO succeeded in attracting a substantial amount of European funding under art. 10 ERDF for a series of 'innovative' pilot projects.

In the 1990s, the loose network relationships were sedimented into a more formal arrangement, the Interreg Steering Committee, involving the economics ministries of the Netherlands, NRW and Lower Saxony, the Dutch provinces and the German district authorities.

De facto, within the confines of its area, the EUREGIO has become an important implementation partner for the European Commission. Due to its expertise and authority in the local context, it enjoys a status that goes far beyond its relatively weak formal position in the vertical network. The EUREGIO is a full member of the Steering Committee and is entitled to propose its chairman.

Formally, the Steering Committee is the ultimate instance in the decision-making process on the allocation of Interreg funds. Practically speaking, however, decisions are rarely imposed on the EUREGIO actors, effectively valuing the professionalism of the secretariat. The interview evidence points to high-trust relationships across the vertical networks (i10, i11, i14), often constituted by long-term working relationships among individuals and high ideological commitment to the CBC cause.

But, apart from such motives created by the social embeddedness of network contacts, for the Dutch and NRW authorities, there is also an administrative rationale for co-operating with the EUREGIO actors. A senior NRW official observed: '... you can't pull projects like a rabbit out of a hat' (i11). As the need to secure the cross-border character of Interreg projects is taken seriously, the EUREGIO has a crucial role as a project animator to secure the successful allocation of Interreg funds. The reliance on the EUREGIO is reflected by the fact that the North Rhine-Westphalia and Dutch ministries do not in general co-ordinate their positions on specific projects prior to SC meetings (i11).

The involvement of the EUREGIO in this vertical network mirrors the general networked set-up of policy implementation in EU regional policy described as multi-level governance (Hooghe 1996; Benz and Eberlein 1999). Given the importance of Interreg, it is also relevant for maintaining the stability of the local network described above. In fact, the local EUREGIO network operates in the 'shadow of hierarchy' cast by the Steering Committee.⁶ To avoid rejection of project proposals by the *Land* or central government, the EUREGIO makes sure that projects have the structural economic impact required by the structural funds regulations. The relatively clear criteria for evaluating project proposals simplify the decision-making process by providing rules to be routinely followed. In case of doubt, the uncertainty-reducing function of these rules is complemented by the 'shadow' of authority exerted by the Dutch and NRW governments as well as the European Commission that is channelled through the secretariat and can be

used to discipline the members of the local network. Hence, the EUREGIO secretariat performs an interface function by mediating between the network of EUREGIO members and the supranational network crystallised in the Steering Committee. On the one hand, the supranational authorities trust in the secretariat's administrative expertise and its ability to prioritise the 'objective' quality of projects over the particularist interests of project applicants. On the other, the local authorities perceive the secretariat as their agent and representative vis-à-vis the higher-level authorities. It can be followed from the high level of interdependence between the local network and the vertical network relationships that, as a newly emerging scale, the EUREGIO is highly dependent on its integration into the supranational policy framework provided by the EU.

Strategic unification

This aspect of emerging new scales refers to their construction of the region as an object of intervention. Early in its history, the EUREGIO actors began to underpin their institution-building strategies by referring to the cross-border space as a unified object to be shaped and constructed (CoE 1972: 111). The ambition of turning the EUREGIO into a 'functional unit in all spheres of life', 'by superseding intra-regional locational competition via developing a specialisation for the unit as a whole' originated in the late sixties, if not earlier (ibid). The EUREGIO was to be transformed from a separated set of marginalised border economies into an integrated economic space. This strategy was formalised as the 'region principle' (Gabbe 1985: 94) and aims to create a 'centrally located area in North-western Europe' able to cater for 20m consumers within a radius of 150km (Gabbe 1985: 95). The creation of *cross-border development concepts* played a major role in this construction of the EUREGIO as a cross-border territorial object of intervention. Such conceptual guidelines defining the intervention space, the objectives to be pursued and the measures to be taken were the precondition for attracting resources from higher level authorities and to develop the EUREGIO from a loose network with strong ceremonial elements into a regional policy agency.

In 1971, a first EUREGIO 'structural analysis' was carried out with EU and national support (Malchus 1986: 36). The study proposed a bundle of objectives and some general guidelines for a possible regional programme (CoE 1972). A further step was the completion of the 1987 'action programme' which contained a long-term development perspective as well as more detailed measures for a multiannual period. The latter part constituted the blueprint for the Interreg Operational Programmes that were later submitted to the European Commission. The development programmes were produced on the basis of expert input provided by a research institute operated by NRW, and presented scientific rationales for *local CBC* as an efficient strategy for overcoming the structural problems of border areas.

The development programmes were relevant both as planning mechanisms and as social-integrative devices. As a multi-annual bundle of project fields and project ideas, distributed evenly both geographically as well as in terms of policy areas, they offered the EUREGIO members an expected probability for gaining access to funding opportunities in the future. By opening up a time horizon associated with a stream of resources to be distributed among a relatively large number of actors, they created incentives to co-operate and to expend resources for a secretariat.

The idea of designing *locally managed*, integrated, multi-sectoral programmes for border areas was conceptually aligned with the emerging regional policy of the European Community from the mid-seventies onwards. The 'programme approach' to regional policy propagated by the European Commission (Tömmel 1994) was rapidly translated into a major catalyst for the mobilisation of border areas by providing a cognitive reference for a new object of governance: a 'cross-border region'.

The rather technical construction of the CBR as an integrated region was complemented by a set of more ceremonial discourses that in turn helped mobilise political support both on the local and supralocal levels. The central discourse is constituted around the concept of the *European* border. In the context of an integrating Europe, the 'border' assumes the quality of a special symbolic marker that was mobilised very effectively by the EUREGIO. By transcending national borders, the EUREGIO claimed to be contributing to European integration 'on the small scale'. Thus, the EUREGIO is perceived as the realisation of an integrated Europe that is close to the citizens, unbureaucratic and local.

Similar views are shared by the European Commission and some academic observers. For the European Commission, and EU-friendly national governments, cross-border regions function as 'test beds for the construction of Europe' (Schulz 1998: 15, cf. also Tränhardt 1993). The background to this discourse is that, if communities on both sides of the borders were to co-operate in the hope of gaining from commonly produced public goods, then *commonalities* had to be emphasised at the expense of national differences. 'Europe' offered itself as the most obvious referent to be invoked as a common identity; it was also an effective symbolic resource vis-à-vis the higher-level actors, i.e. the Land and province authorities, the central governments and the European Commission.

4 Conclusions and implications

This article proposed a framework for analysing processes of rescaling and illustrated the framework with a case study of the EUREGIO. Applied to this specific case, the analysis showed:

- (a) Political mobilisation occurred by establishing collective action among local authorities on both sides of the Dutch-German border area. The initial interest was to create a platform that could leverage the combined political clout of the

border authorities vis-à-vis higher level authorities in the attempt to attract attention and resources to the area. With the advent of new regional policy models that assigned local actors a stronger role in policy design and implementation – particularly promoted by the European Commission (Tömmel 1994) – political support was mobilised for creating and maintaining cross-border governance structures addressing the cross-border space as a new unit of intervention. For both aspects, administrative considerations were primary, and in fact the actors supporting the CBR were almost exclusively local authorities while there was little involvement or interest on the part of other type of collective actors in the EUREGIO.

- (b) Governance building in the EUREGIO focused on the intersection of a local policy network involving local authorities and a vertical policy network involving higher-level authorities, i.e. central governments and the European Commission. An entrepreneurially acting agency, the secretariat, plays an active role as network broker, project animator and carrier of expertise. Both networks are highly interdependent. On the one hand, membership of local border-crossing network would lose much of its attraction without a constant resource flow being secured through funding provided by higher-level authorities. On the other, the vertical network relies on the motivational role and decentralised intelligence of the local network for the inception and orderly execution of funded cross-border projects. The governance aspect of the EUREGIO highlights the ‘inter-scalar’ dimension of re-scaling strategies. The newly emerging territorial unit was constituted in high interdependence with higher-level scales, in particular the EU as a supra-regional policy maker. This process did hence not only involve ‘scaling down’ the level at which cross-border development measures are coordinated but it also involved a change in the logic of co-ordination, or mode of governance, as observed in other cases of shifting scales. In this specific case, instead of highly bureaucratic decision-making within so-called ‘inter-state commissions’ (Aykaç 1994) operating on a national level, the EUREGIO instituted a ‘grass-roots’ agency operating in a constitutional grey space to achieve a far higher degree of mobilisation and policy commitment to cross-border regional measures on the part of local actors.
- (c) Strategic unification in the EUREGIO was inspired by a shared vision around building a ‘functional unit’ serving as object of intervention for unified cross-border policy measures in ‘all spheres of life’. The cross-border region was constructed as an object for intervention via a series of ‘development concepts’ that were informed by scientific-bureaucratic regional policy rationales. These documents served as cognitive and social-integrative devices ensuring the

concertation of the involved networks around a constant and stable ‘theme of interaction’ that has been recognised as an important factor for the stability of networks (Héritier 1995). Simultaneously, this bureaucratic vision was underpinned by a more ceremonial discourse centred around the ‘European’ dimension of the cross-border region.

Table 1: Logics of scale construction within cross-border regions

	EUREGIO	Variations
Political mobilisation	Administrative	Ethno-linguistic, popular (Tyrol) Boosterist local economic interests (Cascadia)
Governance building	Policy entrepreneurship in multi-level network	Inter-state co-ordination (Indonesia-Malaysia-Singapore Triangle) Loosely coupled public-private networks (Greater China)
Strategic unification	Cross-border economic space	Exploitation of complementarities (Asian growth triangles) Addressing externalities (US/Mexico)

The aim of this article was not to present the EUREGIO as the only possible model for the construction of new scales. In fact, the features exhibited by this case can be expected to differ strongly from other cases although there might be a certain degree of isomorphism in relation to other cases of European CBRs. Nevertheless, the dimensions of the proposed framework can be used for creating variation across different cases of scale construction. An initial typology, outlining both the features specific to the EUREGIO as well as potential variations, is presented in Table 1. Accordingly, for instance, the type of political mobilisation in the EUREGIO can be described as ‘administrative’ but in other cases the type of actors and coalitions might be different. For instance, in the Austro-Italian border area, the building of CBC tends to be informed by popular mobilisation driven by party politics (Luverà 1996), or in the case of Cascadia, by a coalition of ‘boosterist’ private-sector interests and think-tanks (Sparke 2002).

In turn, governance building in the EUREGIO was shaped by a self-appointed agency and network broker that, as a successful policy entrepreneur, established a productive degree of interdependence between the local network of municipalities and the policies of a supranational actor, the EU. By contrast, other cases of scale building rely to a stronger degree of inter-agency co-ordination on the national level, as for instance the Indonesia-Malaysia-Singapore Triangle (Grundy-Warr, Peachy and Perry 1999). Growth triangles such as Greater China, in turn, are constituted by a complex web of loosely coupled networks of actors spanning the boundaries between private entrepreneurship and public agency (Sum 2002).

Strategic unification, finally, was provided by an image of a homogenous cross-border economic space overcoming the disadvantages associated with marginal border location. In cases such as regional co-operation arrangements on the US-Mexican, border is it rather the attempt to mitigate negative social and environmental externalities that come to be the unifying discourse and strategic impetus for CBC (Scott 1999). The exploitation of complementarities, expected to induce major boosts of investment and growth, are at the centre of unification discourses in the South-East Asian growth triangles (Sparke et al 2004).

Having proposed a framework for analysing re-scaling processes and sketched a tentative typology, a few concluding comments are in order in view of further research. It is beyond the scope of this article to present a comprehensive typology of scale construction that not only includes CBRs but potentially other processes involving the creation of new or modified scales as different as macro-regional collaboration or special economic zones. However, it has been shown that re-scaling processes vary widely in terms of political mobilisation, governance building and strategic unification. This indicates that it is not appropriate to hold single causal factors responsible for re-scaling processes *tout-court*, and that there is indeed a variety of logics at work, possibly in dependence of the wider institutional contexts in which they occur. This is in fact an important theme for future research. A related open question is whether the features of re-scaling processes 'cluster' into specific configurations in the sense that particular modes of political mobilisation tend to go hand in hand with specific modes of governance and specific discourses of unification.

² For additional details on the EUREGIO, cf. Schack's (1998), Aykaç (1994); Denters, Schobben and van der Veen (1998); Murphy (1993); Goinga (1995); IRS (1994).

³ <http://europa.eu.int>.

⁴ The informal Interessensgemeinschaft ('community of interest') Rhein-Ems (1954), replaced by the more formal Kommunalgemeinschaft Weser-Ems' (1962), on the German side; the Belangengemeenschap Twente-Gelderland and the Samenwerkingsverband Oost-Gelderland (today Regio Achterhoek), on the Dutch side.

⁵ '... the EUREGIO was already there, it was obvious that they were going to do the programme management.' (i1).

⁶ On co-ordination in the 'shadow of hierarchy', cf. Scharpf (1996).
