DSGE Application

DSGE application: Ireland04 Example: SW07 TaBMJ AS07

Conclusion

- DSGE models are arguably the dominant framework for dealing with macro-economic dynamics
- From our perspective, provide a perfect setting for exploring a number of different MCMC issues because
 - highly nonlinear in the parameters
 - · parameters subject to several linear and nonlinear constraints
 - intensive computation required to calculate the likelihood
 - occurrence of multiple modes
- Maximum likelihood estimates can be unreasonable
- Has led to an interest in Bayesian fitting (for example, Lubik and Schorfheide (2004), Fernandez-Villaverde and Rubio-Ramirez (2004), Smets and Wouters (2007))
- Based on single-block MCMC sampling: neither efficient nor scaleable

Introductio

Setup

Approach TaB-MH Marg Lik

DSGE Application

DSGE application: Ireland04 Example: SW07 TaBMJ AS07 $\bullet\,$ To understand the context, consider the model in Ireland (2004)

• This model after linearization around the steady state has the form

 $\begin{aligned} \hat{x}_{t} &= \alpha_{x} \hat{x}_{t-1} + (1 - \alpha_{x}) \mathbb{E}_{t} \hat{x}_{t+1} - (\hat{r}_{t} - \mathbb{E}_{t} \hat{\pi}_{t+1}) + (1 - \omega)(1 - \rho_{a}) \hat{a}_{t} \\ \hat{\pi}_{t} &= \beta \alpha_{\pi} \hat{\pi}_{t-1} + \beta (1 - \alpha_{\pi}) \mathbb{E}_{t} \hat{\pi}_{t+1} + \psi \hat{x}_{t} - \hat{e}_{t} \\ \hat{g}_{t} &= \hat{y}_{t} - \hat{y}_{t-1} + \hat{z}_{t} \\ \hat{x}_{t} &= \hat{y}_{t} - \omega \hat{a}_{t} \\ \hat{r}_{t} &= \rho_{r} \hat{r}_{t-1} + \rho_{\pi} \hat{\pi}_{t} + \rho_{g} \hat{g}_{t} + \rho_{x} \hat{x}_{t} + \varepsilon_{r,t} \\ \hat{a}_{t} &= \rho_{a} \hat{a}_{t-1} + \varepsilon_{a,t} \\ \hat{e}_{t} &= \rho_{e} \hat{e}_{t-1} + \varepsilon_{e,t} \\ \hat{z}_{t} &= \varepsilon_{z,t} \end{aligned}$

Siddhartha Chib, Srikanth Ramamurthy

Introduction

Setup

Approach

TaB-MH Marg Lik

DSGE Application

DSGE application: Ireland04 Example: SW07 TaBMJ AS07 Parameters of interest are

 $\boldsymbol{\theta} = (\omega, \alpha_x, \alpha_\pi, \rho_\pi, \rho_g, \rho_x, \rho_a, \rho_e, \sigma_a, \sigma_e, \sigma_z, \sigma_r)$

which are subject to

- the linear constraints S_L : $\{\omega, \alpha_x, \alpha_\pi\} \in (0, 1), \{\rho_\pi, \rho_g, \rho_x\} \in (0, \infty), \{\rho_a, \rho_e\} \in (0, 1)$
- non linear constraints $1 S_{\Omega}$: σ_i^2 lie in the region that satisfy the usual positivity and positive definiteness constraints

6 / 53

• the determinacy constraint S_D (of a unique stable solution)

Conclusion

Siddhartha Chib, Srikanth Ramamurthy

Introduction

Setup

Approach TaB-MH Marg Lik

DSGE Applicatio

DSGE application: Ireland04 Example: SW07 TaBMJ AS07

Conclusion

- To proceed, it is first necessary to solve the model for the endogenous variables and the expectational variables
- This requires that one first express the given model in the form

 $\mathbf{G}_0(\boldsymbol{\theta})\mathbf{s}_t = \mathbf{G}_1(\boldsymbol{\theta})\mathbf{s}_{t-1} + \mathbf{G}_2(\boldsymbol{\theta})\boldsymbol{\varepsilon}_t + \mathbf{G}_3(\boldsymbol{\theta})\boldsymbol{\eta}_t$

イロト イロト イヨト イヨト 二座

where $\mathbf{G}_{j=0}^3$ are matrices of appropriate dimensions involving the parameters $\boldsymbol{\theta}$ of the model

Siddhartha Chib, Srikanth Ramamurthy

Setup

Marg Lik

DSGE ap-

plication: Ireland04 Example: SW07

AS07

• For instance in the Ireland model if we define

$$\begin{aligned} \mathbf{s}_t &= [\hat{y}_t, \hat{r}_t, \hat{\pi}_t, \hat{g}_t, \hat{x}_t, \hat{a}_t, \hat{e}_t, \hat{z}_t, \mathbb{E}_t \hat{\pi}_{t+1}, \mathbb{E}_t \hat{x}_{t+1}] \\ \boldsymbol{\varepsilon}_t &= [\varepsilon_{a,t}, \varepsilon_{e,t}, \varepsilon_{z,t}, \varepsilon_{R,t}]' \\ \boldsymbol{\eta}_t &= [\hat{\pi}_t - \mathbb{E}_{t-1} \hat{\pi}_t, \hat{x}_t - \mathbb{E}_{t-1} \hat{x}_t] \end{aligned}$$

then it can be written as

 $\mathbf{G}_0(\boldsymbol{\theta})\mathbf{s}_t = \mathbf{G}_1(\boldsymbol{\theta})\mathbf{s}_{t-1} + \mathbf{G}_2(\boldsymbol{\theta})\boldsymbol{\varepsilon}_t + \mathbf{G}_3(\boldsymbol{\theta})\boldsymbol{\eta}_t$

イロト イヨト イヨト イヨト 二日

8 / 53

for suitable choices of matrices $G_{i=0}^3$

Siddhartha Chib, Srikanth Ramamurthy

Introduction

Setup

Approach TaB-MH Marg Lik

DSGE Applicatio

DSGE application: Ireland04 Example: SW07 TaBMJ AS07

Conclusion

• One can then solve the model (by a series of computationally intensive steps) to produce a SSM for the state variables of the form

 $\begin{aligned} \mathbf{y}_t &= \mathbf{a}(\theta) + \mathbf{B}(\theta) \mathbf{s}_t \\ \mathbf{s}_t &= \mathbf{D}(\theta) \mathbf{s}_{t-1} + \mathbf{F}(\theta) \varepsilon_t \end{aligned}$

(日) (四) (E) (E) (E) 三

9/53

where $D(\theta)$ and $F(\theta)$ are awkward implicit functions of the model parameters, obtained from the solution, and $\varepsilon_t \sim \mathcal{N}(\mathbf{0}, \Omega)$, Ω p.d.

Siddhartha Chib, Srikanth Ramamurthy

Introduction

Setup

Approach TaB-MH

Marg Lik

DSGE Applicatio

DSGE application: Ireland04 Example: SW07 TaBMJ AS07

Conclusion

• For example, in the Ireland model the SSM has the form

$$\underbrace{\begin{bmatrix} \hat{g}_t \\ \hat{\pi}_t \\ \hat{r}_t \end{bmatrix}}_{\mathbf{y}_t} = \underbrace{\begin{bmatrix} 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ \mathbf{s}_t = \mathbf{D}(\theta)\mathbf{s}_{t-1} + \mathbf{F}(\theta)\varepsilon_t \end{bmatrix}}_{\mathbf{B}}$$

where $\boldsymbol{\varepsilon}_t \sim \mathcal{N}_4(\boldsymbol{0}, \boldsymbol{\Omega})$

Siddhartha Chib, Srikanth Ramamurthy

Introduction

- Setup
- Approach TaB-MH
- Marg Lik
- Applicatio
- DSGE application: Ireland04 Example: SW07 TaBMJ AS07

Conclusion

- The modeling, the canonical representation, the solve step and the SSM form, can involve a large number of variables and parameters
- For example, the model of Smets and Wouter (2007) comprises 14 equations in 14 endogenous variables and 7 exogenous driving processes and 36 parameters
- Setting this up in canonical form for the solve step requires a 53 dimensional state vector

Inference

murthy Introduction

Estimation of DSGE Models

Siddhartha Chib, Srikanth Rama-

Setup

Approach

TaB-MH Marg Lik

DSGE Applicatio

DSGE application: Ireland04 Example: SW07 TaBMJ AS07

Conclusion

• Given the SSM, the joint density of the data $\mathbf{y}_{n \times T} = {\mathbf{y}_t}, t = 1, \dots, T$, is, of course calculable as

$$f(\mathbf{y}|\boldsymbol{\theta}) = \prod_{t=1}^{T} \left[\frac{1}{(2\pi)^{n/2} |\boldsymbol{\Sigma}_{t|t-1}|^{1/2}} \times \exp\left\{ -\frac{1}{2} y_{t|t-1}^{\prime} \boldsymbol{\Sigma}_{t|t-1}^{-1} y_{t|t-1} \right\} \right] \mathbf{I}_{\mathcal{S}_{L}}(\boldsymbol{\theta}) \mathbf{I}_{\mathcal{S}_{\Omega}}(\boldsymbol{\theta}) \mathbf{I}_{\mathcal{S}_{D}}(\boldsymbol{\theta})$$

Siddhartha Chib, Srikanth Ramamurthy

Introduction

Setup

Approach TaB-MH Marg Lik

DSGE Applicatio

DSGE application: Ireland04 Example: SW07 TaBMJ AS07 • In the Bayesian context, we focus on the posterior density of ${\pmb heta}$

$\pi(\boldsymbol{ heta}|\mathbf{y}) \propto f(\mathbf{y}|\boldsymbol{ heta}) imes \pi(\boldsymbol{ heta})$

イロト イロト イヨト イヨト 二座

and the question is how this complex distribution should be efficiently summarized

Siddhartha Chib, Srikanth Ramamurthy

Introduction

Setup

TaB-MH

Marg Lik

DSGE Application

DSGE application: Ireland04 Example: SW07 TaBMJ AS07

Conclusion

Tailored Block-MH (TaB-MH) algorithm

- Because of the intensity of the solve step, existing methods have relied on a single block RW-MH sampling approach
- Not efficient or scaleable
- We examine an alternative in which parameters are updated within each MCMC cycle by a sequence of M-H steps over (randomly) constructed blocks
- Blocks are constructed randomly because there is no natural blocking scheme in these models
- In addition, tailored proposal densities are used (following Chib and Greenberg (1994, 1995))
- To account for possible irregularities, tailoring is done by simulated annealing (Chib and Ergashev (2008))

Siddhartha Chib, Srikanth Ramamurthy

Introductio

occup

TaB-MH

DSGE Applicatio

DSGE application: Ireland04 Example: SW07 TaBMJ AS07

Conclusion

Algorithm: TaB-MH

- Initialize $\theta^{(0)} \in S_L \cap S_\Omega \cap S_D$ and fix n_0 (the burn-in) and M (the MCMC sample size)
- **2** Randomly generate blocks $(\theta_{j,1}, \theta_{j,2}, \dots, \theta_{j,p_j})$
- **③** Sample each block $\theta_{j,l}$, $l = 1, ..., p_j$, by a M-H step with a tailored proposal density
- Repeat Steps 2-3 n₀ + M times, discard the draws from the first n₀
 iterations and save the subsequent M draws θ^(n₀+1),...,θ^(n₀+M)

Marginal Likelihood

murthy Introduction

Estimation of DSGE Models

Siddhartha Chib, Srikanth Rama-

Setup

Approach TaB-MH

Marg Lik

DSGE Application

DSGE application: Ireland04 Example: SW07 TaBMJ AS07

Conclusion

- Interestingly, the framework of Chib (1995), and its M-H version in Chib and Jeliazkov (2001), can be applied in this setting, with suitable modifications to accommodate randomized blocking
- Starting point is the identity

$$m(\mathbf{y}) = rac{f(\mathbf{y}|oldsymbol{ heta}^*)\pi(oldsymbol{ heta}^*)}{\pi(oldsymbol{ heta}^*|\mathbf{y})},$$

where the terms in the numerator are readily available

• Posterior ordinate estimated from a marginal-conditional decomposition

Siddhartha Chib, Srikanth Ramamurthy

Introduction

Setup

Approach

Marg Lik

DSGE Applicatio

DSGE application: Ireland04 Example: SW07 TaBMJ AS07

Conclusion

Example: Dynamic Factor Model

Suppose

 $\begin{aligned} \mathbf{y}_t &= \mathbf{a} + \mathbf{B}\mathbf{s}_t + \mathbf{u}_t \\ \mathbf{s}_t &= \mathbf{G}\mathbf{s}_{t-1} + \varepsilon_t \end{aligned}$

where \mathbf{y}_t is a 10 × 1 vector of observables at time t, \mathbf{s}_t is a 5 × 1 vector of time-t unobserved (latent) states, **a**, **B** and **G** are matrices of appropriate dimensions, $\mathbf{u}_t \sim \mathcal{N}_{10}(\mathbf{0}, \mathbf{\Sigma})$ and $\boldsymbol{\varepsilon}_t \sim \mathcal{N}_{5}(\mathbf{0}, \mathbf{\Omega})$.

Siddhartha Chib, Srikanth Ramamurthy

Introduction

Approacl

TaB-MH Marg Lik

DSGE Applicatio

DSGE application: Ireland04 Example: SW07 TaBMJ AS07 Identification restrictions and parameter constraints

- G is diagonal
- $\mathbf{B}_{i,i} = 1$ for i = 1, ..., 5, $\mathbf{B}_{i,j} = 0$ for i, j = 1, ..., 5, j > i,
- $\boldsymbol{\Sigma} = \text{diag}\{\sigma_i^2\}_{i=1}^{10}$
- $\bullet \ \Omega = I_5.$
- reparameterize Σ as

$$\mathbf{\Sigma}^* = \mathsf{diag}\{\sigma_i^{2*}\}_{i=1}^{10}; \qquad \sigma_i^{2*} \in \mathcal{R}$$

where $\sigma_i^2 = \exp\left(\sigma_i^{2*}\right)$

- stationarity restriction: $\Theta_{\mathcal{S}} = \{ \theta : abs(eig(G)) < 1 \}$
- This leads to 60 unknown parameters that we collect in the vector ${m heta}$

murthy Introduction

Estimation of DSGE Models

Siddhartha Chib, Srikanth Rama-

Setup

Approach TaB-MH Marg Lik

DSGE Applicatio

DSGE application: Ireland04

Example SW07 TaBMJ AS07

Conclusion

- We consider the effect of varying the number of blocks (stages), as well as the sample size (n_1) in the reduced MCMC runs, on the marginal likelihood estimate (and the resulting numerical standard error)
- Report results from both two stage and 3 stage decompositions of the posterior ordinate
 - Based on 5,000, 10,000 and 15,000 draws in the reduced runs
- Also compare the results to the estimate of the marginal likelihood under the RW-MH algorithm (1 stage)

Based on 75,000, 150,000 and 250,000 draws

DSGE Application

DSGE application: Ireland04

Example: SW07 TaBMJ

Conclusion

• Large scale model: 53 dimensional state vector and 36 parameters

- Locating the posterior mode is challenging to say the least
 - Modal ordinate found using SA is around -877.72 in the log scale
 - In contrast, the modal ordinate reported in SW07 is around -906.29
 - TaB-MH explores even higher regions

TaBMJ AS07

Conclusion

Extension to multi-modal problems

- For simplicity, consider sampling a bimodal distribution
- Assume that the modal values have been found by initial optimization
- Let the location of the two modes be μ_1 and μ_2
- $\bullet\,$ Also, let ${\sf V}_1$ and ${\sf V}_2$ denote the inverse of the negative Hessian at the two modes

Siddhartha Chib, Srikanth Ramamurthy

Introduction

Setup

Approach TaB-MH Marg Lik

DSGE Applicatio

DSGE application: Ireland04 Example: SW/07

 α

TaBMJ AS07

Conclusion

• Now TaB-MH algorithm is used as above

• But every few (say a 100) iterations we generate a proposal θ^{\dagger} from the mixture density

$$q(\boldsymbol{\theta}|\mathbf{y}) = p t(\boldsymbol{\theta}|\boldsymbol{\mu}_1, \mathbf{V}_1, \nu_1) + (1-p) t(\boldsymbol{\theta}|\boldsymbol{\mu}_2, \mathbf{V}_2, \nu_2),$$

which we accept with probability

$$\begin{aligned} & (\boldsymbol{\theta}, \boldsymbol{\theta}^{\dagger} | \mathbf{y}) = \\ & \min \left\{ \frac{f(\mathbf{y} | \boldsymbol{\theta}^{\dagger}) \pi(\boldsymbol{\theta}^{\dagger})}{f(\mathbf{y} | \boldsymbol{\theta}) \pi(\boldsymbol{\theta})} \frac{p \, t(\boldsymbol{\theta} | \boldsymbol{\mu}_{1}, \mathbf{V}_{1}, \boldsymbol{\nu}_{1}) + (1 - p) \, t(\boldsymbol{\theta} | \boldsymbol{\mu}_{2}, \mathbf{V}_{2}, \boldsymbol{\nu}_{2})}{p \, t(\boldsymbol{\theta}^{\dagger} | \boldsymbol{\mu}_{1}, \mathbf{V}_{1}, \boldsymbol{\nu}_{1}) + (1 - p) \, t(\boldsymbol{\theta}^{\dagger} | \boldsymbol{\mu}_{2}, \mathbf{V}_{2}, \boldsymbol{\nu}_{2})}, 1 \right\} \end{aligned}$$

Siddhartha Chib, Srikanth Ramamurthy

Introduction

Setup

Approach TaB-MH Marg Lik

DSGE Applicatio

DSGE application: Ireland04 Example: SW07

TaBMJ AS07

Conclusion

Example: Two component mixture of six dimensional normals

• Pick a modal value (μ_1) from AS07 model and set the other mode (μ_2) to $15\times\mu_1$

 μ_1 : (1.41, 0.81, 0.49, 0.80, 1.07, 0.30) μ_2 : (21.15, 12.15, 7.35, 12.00, 16.05, 4.50)

- Also variance equated to the reduced variance at the two modes in AS07 model
- Target density

 $f_X(x) = 0.2 \mathcal{N}(\boldsymbol{\mu}_1, \boldsymbol{\Sigma}_1) + 0.8 \mathcal{N}(\boldsymbol{\mu}_2, \boldsymbol{\Sigma}_2)$

Siddhartha Chib, Srikanth Ramamurthy

Introduction

Setup

Approach TaB-MH Marg Lik

DSGE Applicatio

DSGE application: Ireland04

Example: SW07 TaBMJ

AS07

Conclusion

- TaBMJ-MH algorithm sampler initialized at μ_2
- p = 0.5, $\nu = 5$ in usual TaB-MH step, $\nu = 5$ in mode jumping step
- Sampler run for 25,000 iterations without any burn-ins (for illustration purposes)

Application

DSGE application: Ireland04 Example: SW07 TaBMJ AS07

Conclusion

• Has opened up the possibility of fitting even larger DSGE models than those currently being fit

- Approach can be applied to Bayesian problems in general
- For example, we have applied it successfully to a 168 dimensional theory-driven yield curve model with multiple change points
- Other applications are ongoing
